	Norfolk county, total	16	5	.3	2.2	.2	.4	1.5	3.9	3.2	6.7	.4	.2	2.2
14	Nonmetallic minerals, except fuels	16	5	.3	2.2	.2	.4	1.5	3.9	3.2	6.7	.4	.2	2.2
142	Crushed and broken stone	3	3	(CC)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	.8

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for their own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represent the number of reports received, while county establishment counts represent the number of reports that indicated operations in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

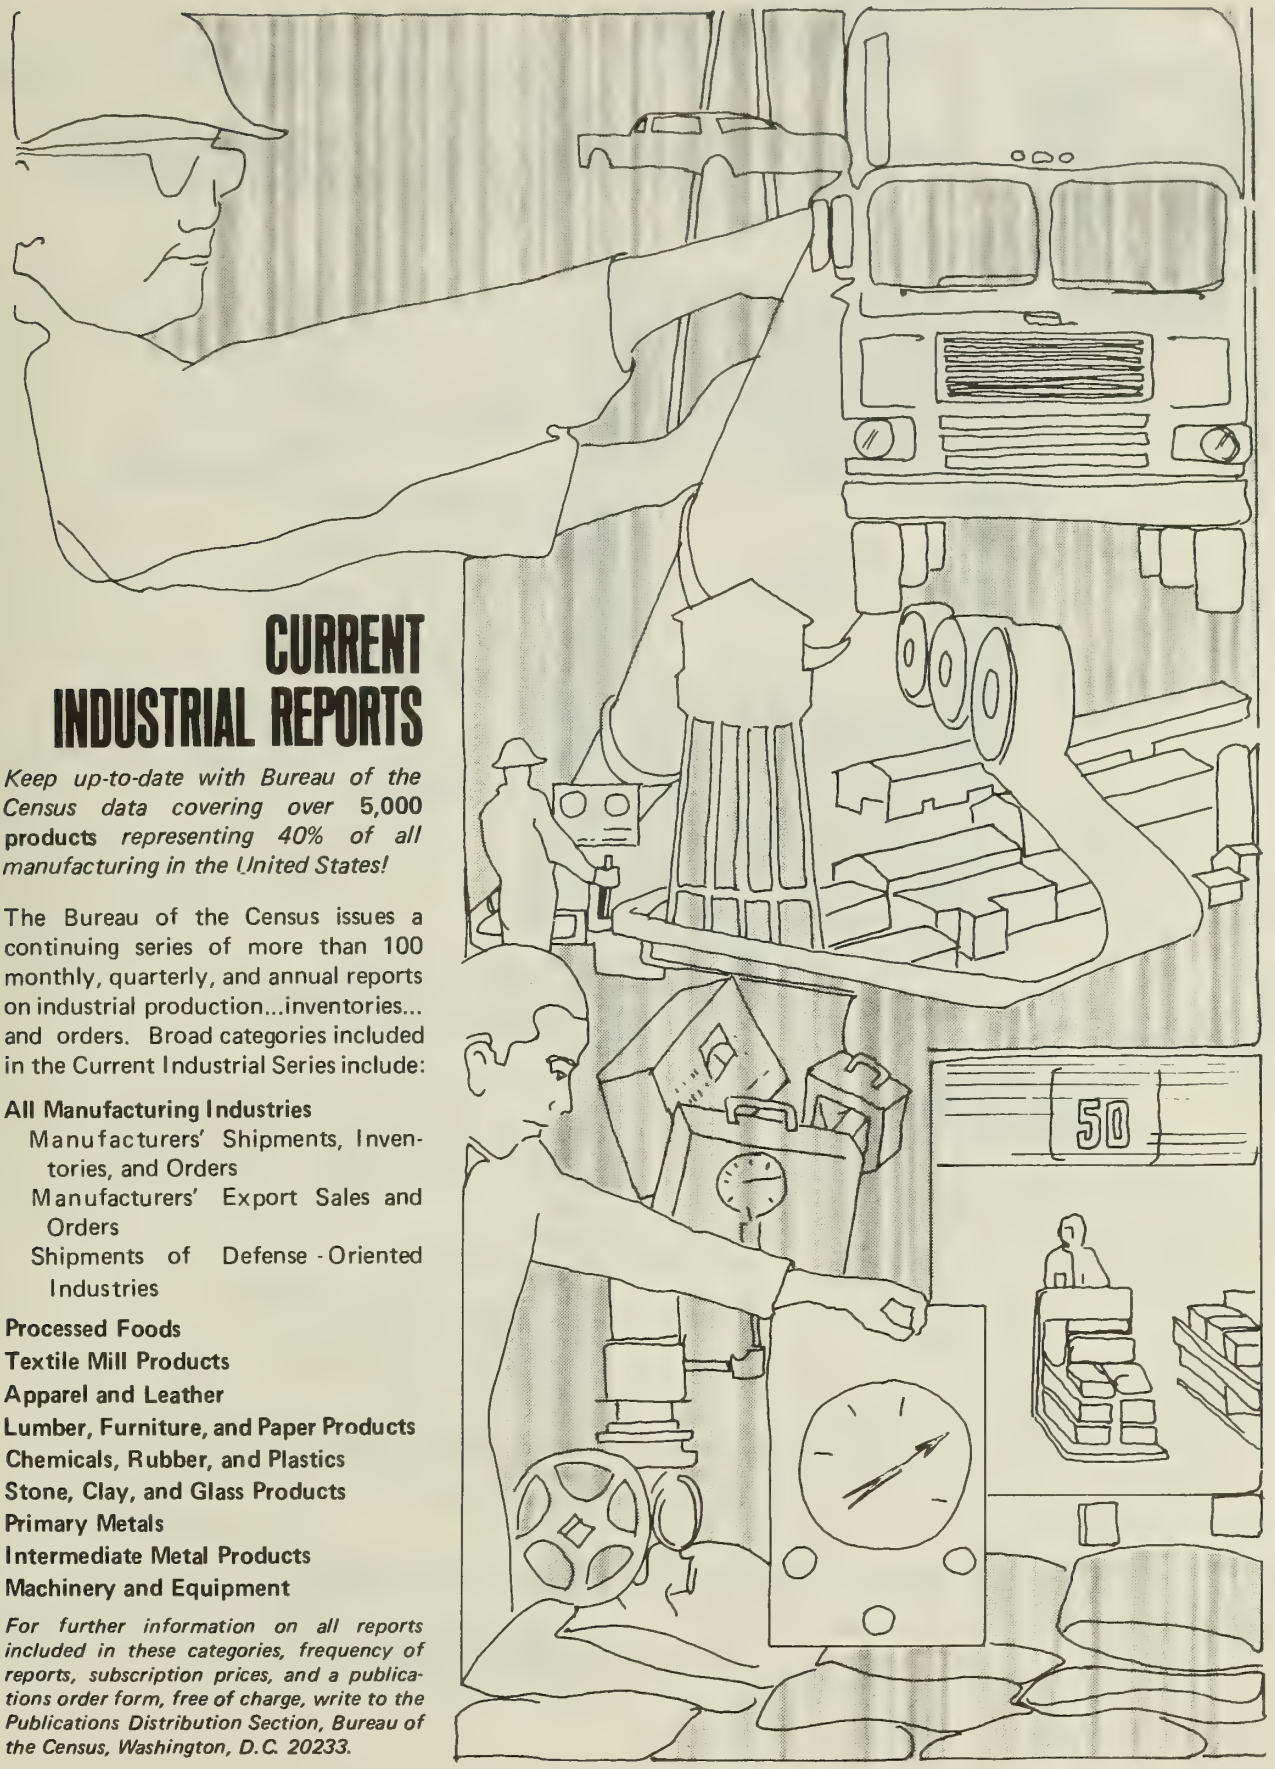
Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.



For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

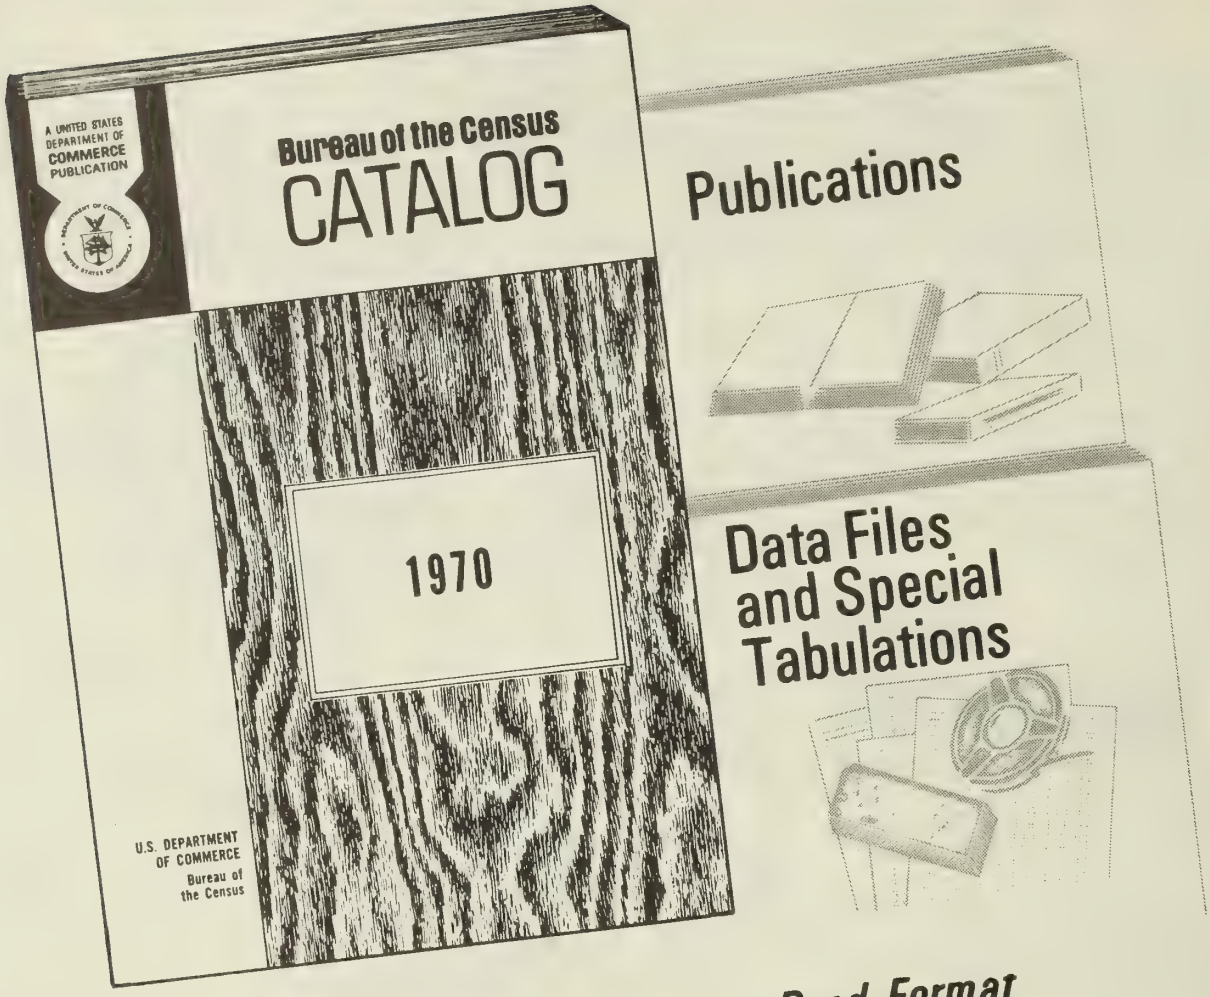
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST
- New England
- Middle Atlantic

NORTH CENTRAL
- East North Central
- West North Central

SOUTH
- South Atlantic
- East South Central
- West South Central

WEST
- Mountain
- Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]459	85	12.2	88.0	10.1	20.5	71.3	289.9
1963	[1]691	78	12.2	75.2	10.1	19.9	59.5	223.1
1958	539	87	14.3	73.2	11.9	22.1	59.3	158.0
1954	567	94	16.4	76.3	13.7	28.2	61.1	149.1
Including operations in manufactures:								
1967	484	89	12.6	90.5	10.5	21.3	73.8	302.4
1963	742	83	12.4	76.7	10.4	20.5	61.0	232.7
1958	574	91	14.7	74.7	12.2	22.7	60.8	165.5
1954[2]	591	98	16.7	77.3	14.0	28.8	62.2	153.0
1939	[3]620	(NA)	17.0	23.9	15.2	29 0	19.7	64.9
1919[4]	128	(NA)	33.5	55.1	31.5	(NA)	50.8	79.8
1909[4]	133	(NA)	41.6	30.4	39.9	(NA)	28.1	53.0
1902[5]	[3]196	(NA)	32.9	21.6	[6]31.4	(NA)	19.8	39.1
Excluding oil and gas extraction industries:								
1967	313	70	11.2	80.9	9.3	19.0	66.4	255.9
1963	451	63	10.5	65.4	8.9	17.5	52.2	172.6
1958	380	71	12.9	65.9	10.8	19.7	53.9	141.7
1954[2]	329	77	14.6	67.8	12.2	25.0	54.2	122.1
1939	[3]187	(NA)	13.5	13.7	12.4	24.0	15.9	42.6
1929[7]	161	(NA)	22.3	32.7	20.9	(NA)	28.9	72.2

Kind of operation and year	Selected expenses				Value of shipments and receipts[8]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[9]234.4	([9])	12.2	([9])	483.7	52.8	(NA)
1963	63.6	30.7	59.7	15.5	316.4	76.1	6.5
1958	43.9	15.8	17.1	8.8	218.3	25.0	4.3
1954	41.8	[10]6.9	20.1	23.5	194.7	46.8	3.7
Including operations in manufactures:							
1967	[11]248.4	([11])	([11])	([11])	498.0	(NA)	(NA)
1963	[12]65.0	30.7	[12]59.7	[13]15.5	327.5	[13]76.1	[13]6.5
1958	[12]45.5	15.8	[12]17.1	[13]13.8	227.3	[13]25.0	[13]4.3
1954[2]	[12]42.6	[10]6.9	[12]20.1	[13]23.5	199.4	[13]46.8	[13]3.7

1919[4]	24.0	-	(Z)	(NA)	103.9	(NA)	[14]10.8
1909[4]	14.2	-	.5	(NA)	67.7	(NA)	(NA)
1902[5]	3.8	(NA)	.1	(NA)	48.0	(NA)	(NA)
Excluding oil and gas extraction industries:							
1967	[11]152.2	([11])	([11])	([11])	401.8	(NA)	(NA)
1963	[12]75.6	([15])	[12]47.1	[13]12.8	245.0	[13]63.2	[13]5.3
1958	[12]38.9	15.4	[12]12.1	[13]6.9	193.4	[13]21.6	[13]3.5
1954[2]	[12]34.0	6.9	[12]12.4	[13]19.5	156.2	[13]38.7	[13]2.9
1939	10.6	(NA)	.2	(NA)	53.4	(NA)	3.4
1929[7]	22.9	(NA)	.1	3.3	95.3	(NA)	7.9

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnote for Table 1. Michigan--Continued

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 154 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments.

[3]Represents number of mines and quarries, number of natural gas liquids plants, and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[4]Excludes data for sand, gravel, common clay, and shale operations, and for limestone quarries operated as parts of cement and lime plants. In 1939, the value of products of such establishments was $3,528 thousand.

[5]Excludes data for sand, gravel, common clay, and shale operations, and for stone quarries operated as parts of cement plants producing cement valued at $2,134 thousand. Includes data for lime plants producing lime valued at $208 thousand.

[6]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[7]Excludes data for common clay and shale mining operations. In 1939, there were 12 such mines, with products valued at $201 thousand. For each of the census years 1919, 1909, and 1902, only one oil and gas extraction establishment was reported; hence, the figures shown for these years for "All operations" were also approximately comparable to the figures shown for later years for "Excluding oil and gas extraction industries."

[8]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[9]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[10]Excludes the cost of natural gas processed at natural gas liquids plants, but includes the estimated value prior to processing of natural gas liquids contained in such gas.

[11]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy. For dimension stone in manufacturers in 1963 and 1958, the cost of contract work and purchased machinery installed minus capital expenditures was also included.

[13]Excludes data for crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments and for 1963 and 1958, for dimension stone operations in manufactures.

[14]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 2 percent of the total kw.-hrs. equivalent of energy used.

[15]Figures for cost of minerals received for preparation are included with those for cost of supplies, purchases for resales, and purchased fuels and electric energy.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees [1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number [1] (1,000)	Payroll [1] (million dollars)	Number [1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	25	4	0.4	2.5	0.4	0.8	2.5	12.5	1.8	14.3	(NA)	0.3	9.7
142	Crushed and broken stone (limestone)	4	2	0.2	1.2	0.2	0.3	1.2	7.9	1.0	8.9	(NA)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]	
				Total	Underground mines	Open-pit mines	Combination methods, well operations, and other methods	Total	Underground mines	Open-pit mines	Combination methods and other methods			
	Michigan:

	Value added in mining..mil.dol..	(D)	(D)	(D)	-	(D)	(D)	6.4	-	6.4	-	-	-	-

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.
[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	459	691	Cost of supplies, total.....million dollars..	246.6	169.5
With 0 to 19 employees.....do....	374	613	Supplies used, minerals received for preparation, and purchased machinery.....do....	205.8	(NA)
With 20 to 99 employees.....do....	57	49	Cost of resales.....do....	3.5	(NA)
With 100 or more employees.....do....	28	29	Purchased fuels consumed.....do....	-	-
All employees (average for year).....1,000..	12.2	12.2	Electric energy:		
			Quantity purchased.....million kw.-hrs..	11.5	(NA)
Payroll (all employees), total for year.....million dollars..	88.0	75.2	Cost.....million dollars..	13.5	(NA)
			Generated less sold.....million kw.-hrs..	489.7	(NA)
Production, development, and exploration workers:			Contract work.....million dollars..	12.2	59.7
Average for the year.....1,000..	10.1	10.1	Value of shipments and receipts (including resales), total.....do....	483.7	316.4
March.....do....	9.9	(NA)	Value of resales.....do....	4.1	(NA)
May.....do....	10.7	(NA)			
August.....do....	11.1	(NA)	Value added in mining.....do....	289.9	223.1
November.....do....	8.8	(NA)			
Man-hours.....millions..	20.5	19.9	Capital expenditures (except land and mineral rights), total.....do....	52.8	76.1
Wages.....million dollars..	71.3	59.5	Mineral development and exploration.....do....	10.1	10.7
			New structures and additions.....do....	15.2	65.4
Supplemental labor cost not included in payroll.....do..	11.0	(NA)	New machinery and equipment.....do....	25.4	
			Used plant and equipment.....do....	2.1	
Legally required expenditures, including Social Security contributions.....do..	5.3	(NA)	Mineral development and exploration expenditures, total.....do....	-	-
Payments for voluntary programs.....do..	5.7	(NA)	Capitalized.....do....	-	-
			Expensed.....do....	-	-

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963	
		Establishments [1]		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)
Michigan, total	459	33	-	-	171	255
0 to 4 employees	246	3	-	-	102	141
5 to 9 employees	78	2	-	-	32	44
10 to 19 employees	50	-	-	-	18	32

Standard Notes: - Represents zero.

[1] See table 5, footnote 1.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]226	65	12.9	98.7	10.1	19.8	70.7	415.0
1963	[1]334	67	13.2	91.0	9.9	18.9	59.5	367.7
1958	289	89	17.2	97.1	11.7	22.3	59.5	311.7
1954	292	84	17.0	75.5	13.8	26.4	56.5	290.2
Including operations in manufactures:								
1967	254	71	13.4	102.0	10.5	20.7	73.2	422.4
1963	365	73	13.7	93.3	10.3	19.7	61.2	373.0
1958	317	96	18.2	101.5	12.6	24.2	63.0	319.7
1954[2]	300	88	17.8	78.4	14.5	27.9	58.9	294.0
1939[3]	[4]178	(NA)	8.1	13.4	6.9	13.2	10.0	91.6
1929[5]	150	(NA)	13.0	21.5	11.7	(NA)	18.3	116.7
1919[6]	145	(NA)	18.8	32.9	17.5	(NA)	29.8	109.0
1909[6]	189	(NA)	18.2	13.8	16.9	(NA)	12.2	47.5
1902[7]	[8]176	(NA)	10.6	7.0	[9]9.9	(NA)	6.5	22.5

Kind of operation and year	Selected expenses				Value of shipments and receipts[10]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[11]217.9	([11])	33.6	([11])	584.4	82.1	(NA)
1963	97.2	46.8	5.2	10.4	502.1	25.2	10.9
1958	75.9	29.7	11.0	7.5	420.7	15.3	7.8
1954	56.7	4.6	30.8	25.6	343.9	64.0	2.6
Including operations in manufactures:							
1967	[12]253.0	([12])	([12])	([12])	593.3	(NA)	(NA)
1963	[13]98.2	47.1	[13]5.2	[14]10.5	508.7	[14]25.3	[14]10.9
1958	[13]78.9	29.7	[13]11.0	[14]7.6	431.6	[14]15.3	[14]7.9
1954[2]	[13]58.9	5.1	[13]30.8	[14]25.8	350.4	[14]64.2	[14]2.7
1939[3]	7.3	(NA)	.1	(NA)	98.9	(NA)	1.7
1929[5]	14.2	(NA)	1.5	3.0	132.4	(NA)	4.0
1919[6]	19.2	-	2.2	(NA)	130.4	(NA)	[15]5.7
1909[6]	9.0	-	2.2	(NA)	58.7	(NA)	(NA)
1902[7]	2.9	(NA)	.3	(NA)	25.7	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract services operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 36 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for any sand and gravel mining operations in manufacturing establishments. All figures except number of establishments exclude data for 2 common clay pits included in manufacturing establishments.

[3]Except, in part, for value of shipments and value added, excludes data for limestone and granite dimension stone dressing plants operated in conjunction with quarries. The value added in dressing granite at such operations was $51 thousand; this value has been included in the value of shipments and value added in mining. The comparable value for limestone is not available.

[4]Represents number of mines and quarries.

[5]Excludes data for clay mining operations included in manufacturing establishments. There were about 6 such mines in 1939 with products valued at about $114 thousand.

[6]Excludes data for sand and gravel mining operations included in manufacturing establishments and for stone quarries operated as parts of cement and lime plants. In 1929, there were 25 such operations with products valued at $2,042 thousand. See also footnote 8.

[7]Excludes data for sand, gravel, common clay, and shale mining operations in manufacturing establishments. Includes data for 2 cement plants and an unknown number of lime plants producing lime value at $76 thousand.

[8]Represents number of producing mines and quarries.

[9]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[10]For sand and gravel and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishments. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For all other years, represents net production and excludes this duplication.

[11]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13]For sand and gravel and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale and purchased fuels and electric energy.

[14]Excludes data for sand and gravel and clay mining operations in manufacturing establishments.

[15]Excludes purchased electric energy. For 1929, the quantity of purchased electricity for such operations amounted to only 3 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	226	65	12.9	98.7	10.1	19.8	70.7	415.0	251.5	584.4	82.1	13.2	367.7
10	Metal mining	58	38	HH	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	11.4	350.8
1011	Iron ores	50	36	HH	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	11.2	348.1
1081	Metal mining services	6	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.3	2.7
13	Oil and gas extraction	6	1	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
131	Crude petroleum and natural gas	3	1	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1312	Crude petroleum	3	1	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
14	Nonmetallic minerals, except fuels	162	26	1.7	11.6	1.3	2.6	8.3	21.4	10.6	29.0	3.0	1.8	16.9

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	28	6	0.5	3.3	0.4	0.9	2.5	7.4	1.5	8.9	[2]0.1	0.4	5.3
1411	Dimension stone	5	5	0.4	2.8	0.3	0.7	2.0	5.6	1.1	6.7	0.1	0.4	4.0
144	Sand and gravel	19	1	0.1	0.5	0.1	0.2	0.5	1.5	0.3	1.8	(NA)	(Z)	1.2

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

[2] Represents capital expenditures for the Dimension Stone Industry only.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

10	Metal mining	36	24	HH	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	6.6	218.4
101	Iron ores	29	22	7.6	58.6	6.0	11.8	42.8	267.5	150.9	350.4	67.9	6.5	217.9

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

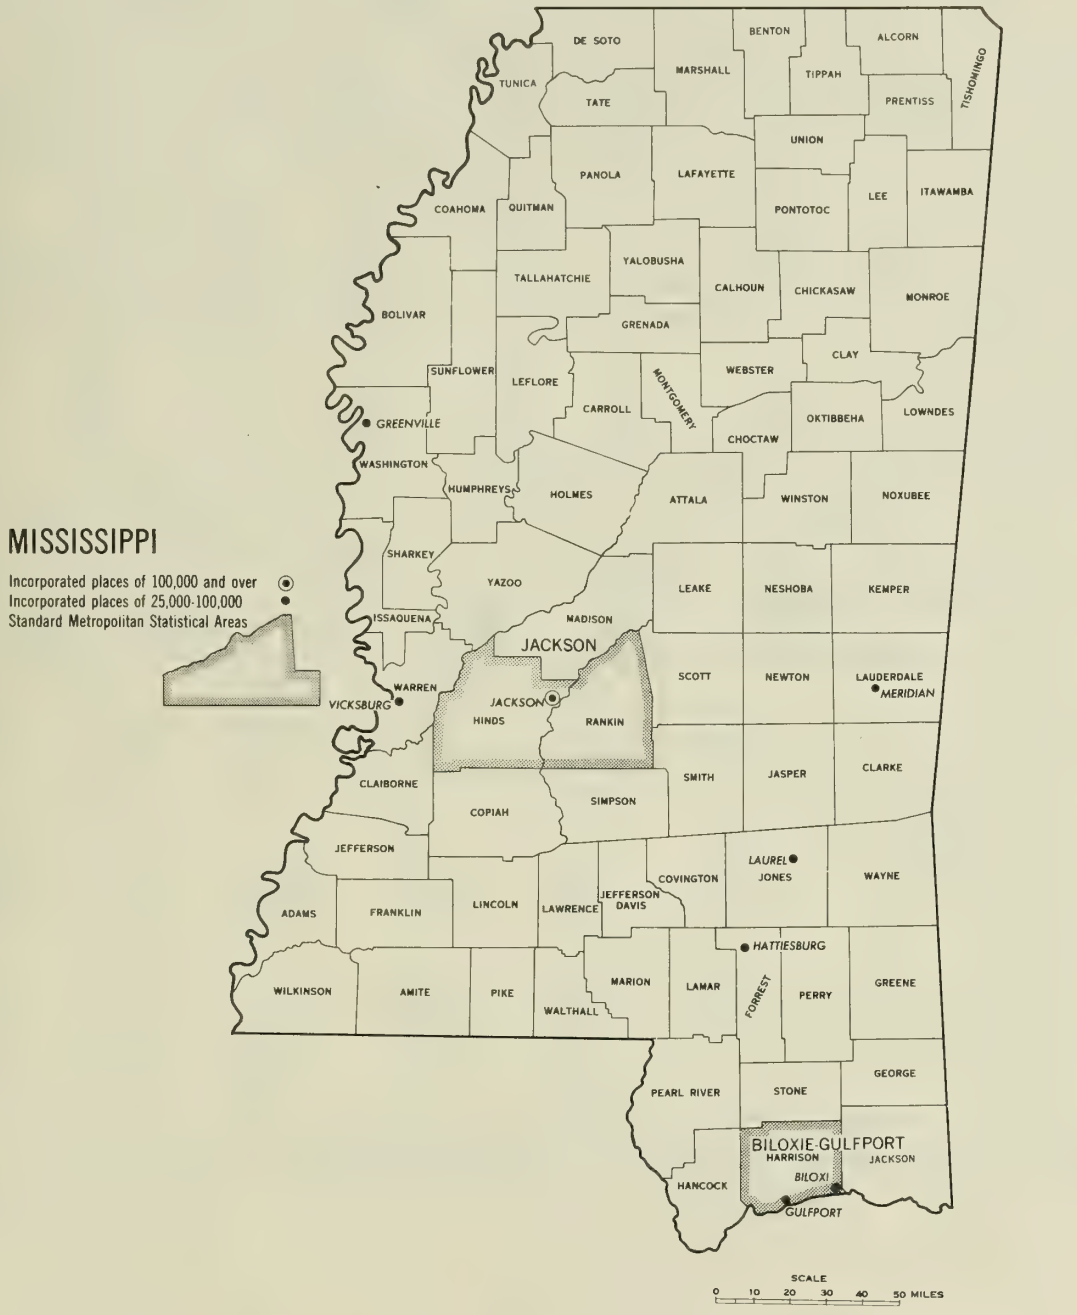
In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:



NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]307	69	4.3	30.0	3.4	7.3	20.4	189.6
1963	[1]369	70	5.3	29.8	4.0	8.1	19.9	200.5
1958	255	64	5.3	26.6	4.1	8.8	19.0	135.3
1954	214	51	3.8	15.6	3.1	6.3	11.6	94.3
Including operations in manufactures:								
1967	319	70	4.4	30.4	3.5	7.5	20.8	190.7
1963	389	72	5.4	30.2	4.1	8.3	20.3	201.9
1958	269	64	5.3	26.7	4.2	8.9	19.1	136.2
1954	226	52	3.8	15.7	3.1	6.4	11.8	94.9
1939[2]	[3]73	(NA)	.7	.7	.6	1.2	.4	1.1
Excluding oil and gas extraction industries:								
1967	70	14	.9	4.6	.8	1.7	3.5	12.1
1963	87	16	1.0	3.5	.8	1.8	3.0	9.4
1958	71	14	.9	3.0	.8	1.7	2.4	9.6
1954	61	16	.8	2.3	.7	1.7	2.1	7.3
1939	[3]45	(NA)	.6	.4	.5	1.0	.3	1.1
1929[4]	13	(NA)	.4	.4	.4	(NA)	.3	.8

Kind of operation and year	Selected expenses				Value of shipments and receipts[6]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation[5] (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[7]56.0	([7])	34.7	([7])	230.9	49.4	(NA)
1963	35.1	18.5	40.5	10.9	266.4	39.1	5.1
1958	30.2	15.4	28.4	11.1	188.0	32.5	4.5
1954	[8]18.6	([8])	19.1	11.3	120.2	23.0	4.0
Including operations in manufactures:							
1967	[9]91.8	([9])	([9])	([9])	233.1	(NA)	(NA)
1963	[10]35.6	18.5	[10]40.5	[11]10.9	268.4	[11]39.1	[11]5.1
1958	[10]30.5	15.4	[10]28.4	[11]11.1	189.2	[11]32.5	[11]4.5
1954	[8] [10]18.8	([8])	[10]19.1	[11]11.3	121.0	[11]23.0	[11]4.0
1939[2]	.5	(NA)	.5	(NA)	2.1	(NA)	.2
Excluding oil and gas extraction industries:							
1967	[9]7.8	([9])	([9])	([9])	18.1	(NA)	(NA)
1963	[10]3.5	(Z)	[10].5	[11]1.1	13.2	[11]1.2	[11].4
1958	[10]3.2	(Z)	[10].3	[11].7	12.6	[11]1.2	[11].3
1954	[10]2.5	-	[10].5	[11].9	10.3	[11].9	[11].2
1939	.3	(NA)	(Z)	(NA)	1.4	(NA)	.1
1929[4]	.3	(NA)	(Z)	.1	1.1	(NA)	.1

Note: See appendix A for an explanation of terms used. For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--Mississippi--Continued

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the Census. In 1963, there were 49 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for 2 oil and gas field services establishments.

[3]Represents number of mines and quarries, number of natural gas liquids plants, and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[4]All figures except number of establishments include data for one limestone quarry in Louisiana. Excludes data for common clay and shale operations; in 1939, there were 6 such pits with products valued at $34 thousand.

[5]For years prior to 1958, excludes the cost of natural gas processed at natural gas liquids plants.

[6]For crushed and broken stone and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958 and 1954, represents gross value of shipments and contains duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For 1939 and 1929, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[7]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[8]The cost of minerals received for preparation is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[9]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[10]For crushed and broken stone and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchased fuels and electric energy.

[11]Excludes data for crushed and broken stone and clay mining operations in manufacturing establishments.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	307	64	4.3	30.0	3.4	7.3	20.4	189.6	90.7	230.9	49.4	5.3	200.5
13	Oil and gas extraction	249	56	3.5	25.8	2.7	5.8	17.3	178.6	84.0	215.0	47.6	4.4	192.5
131	Crude petroleum and natural gas	107	22	1.5	12.5	.8	1.9	6.0	147.7	60.1	165.0	42.8	1.9	162.8
1312	Crude petroleum	99	21	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	1.8	156.5
1313	Natural gas	8	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	6.3
1321	Natural gas liquids	8	-	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	4.4
138	Oil and gas field services	134	34	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	2.4	25.3
1381	Drilling oil and gas wells	33	19	.9	6.3	.8	1.8	5.5	11.7	10.0	19.5	2.3	1.6	19.3
1382	Oil and gas exploration services	29	3	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.3	1.8
1389	Oil and gas field services, n.e.c.	72	12	.8	4.9	.7	1.5	3.8	13.7	4.8	16.8	1.6	.5	4.3
14	Nonmetallic minerals, except fuels	58	13	.8	4.2	.7	1.5	3.1	10.9	6.7	15.9	1.7	.9	8.0
144	Sand and gravel	44	8	.5	3.0	.4	1.0	2.2	6.7	4.4	9.6	1.5	.7	4.9
1442	Construction sand and gravel	43	8	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
145	Clay and related minerals	11	5	.2	1.1	.2	.4	.9	4.0	2.2	5.9	.3	(NA)	(NA)
1452	Bentonite	7	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	12	1	0.1	0.4	0.1	0.2	0.4	1.1	1.1	2.2	(NA)	0.1	1.4

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.
[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	307	369	Cost of supplies, total.....million dollars..	90.7	266.4
With 0 to 19 employees.....do....	238	299	Supplies used, minerals received for preparation, and purchased machinery.....do....	50.8	(NA)
With 20 to 99 employees.....do....	65	60	Cost of resales.....do....	.2	(NA)
With 100 or more employees.....do....	4	10	Purchased fuels consumed.....do....	3.7	(NA)
All employees (average for year).....1,000..	4.3	5.3	Electric energy:		
Payroll (all employees), total for year.....million dollars..	30.0	29.8	Quantity purchased.....million kw.-hrs..	83.2	(NA)
			Cost.....million dollars..	1.3	(NA)
			Generated less sold.....million kw.-hrs..	14.0	(NA)
			Contract work.....million dollars..	34.7	40.5
Production, development, and exploration workers:					
Average for the year.....1,000..	3.4	4.0	Value of shipments and receipts (including resales), total.....do....	230.9	266.4
March.....do....	3.2	(NA)	Value of resales.....do....	.4	(NA)
May.....do....	3.4	(NA)			
August.....do....	3.5	(NA)			
November.....do....	3.3	(NA)	Value added in mining.....do....	189.6	200.5
Man-hours.....millions..	7.3	8.1	Capital expenditures (except land and mineral rights), total.....do....	49.4	39.1
Wages.....million dollars..	20.4	19.9	Mineral development and exploration.....do....	24.3	20.3
			New structures and additions.....do....	5.1	
Supplemental labor cost not included in payroll.....do..	2.8	(NA)	New machinery and equipment.....do....	17.7	18.8
			Used plant and equipment.....do....	2.3	
Legally required expenditures, including Social Security contributions.....do..	1.6	(NA)	Mineral development and exploration expenditures, total.....do....	35.8	(NA)
Payments for voluntary programs.....do..	1.3	(NA)	Capitalized.....do....	24.3	20.3
			Expensed.....do....	11.5	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963	
		Establishments[1]		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	Mississippi, total	307	69	4.3	30.0	3.4	7.3	20.4	189.6	90.7	230.9	49.4	5.3	200.5
	COUNTIES[2]													
	Adams county, total	72	17	.9	5.8	.7	1.6	4.4	21.2	10.6	27.2	4.7	.7	21.2

13	Oil and gas extraction	26	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment; purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

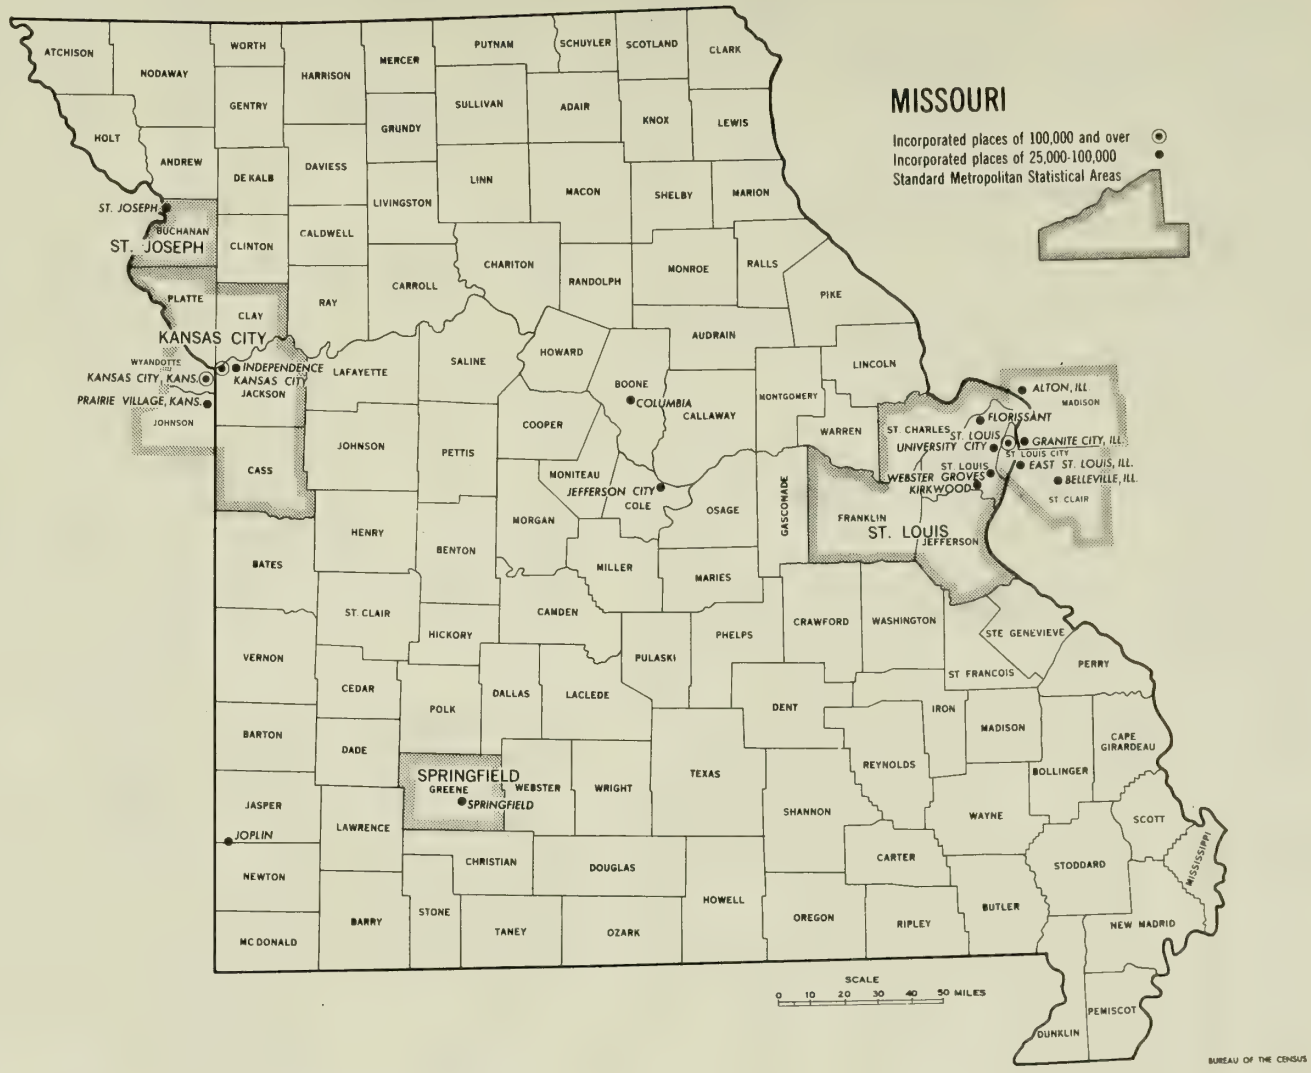
Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST
- New England
- Middle Atlantic

NORTH CENTRAL
- East North Central
- West North Central

SOUTH
- South Atlantic
- East South Central
- West South Central



WEST
- Mountain
- Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1919[7]	6.8	(Z)	.4	(NA)	33.4	(NA)	[14]3.8
1909[7]	7.0	1.5	.3	(NA)	31.7	(NA)	(NA)
1902[8]	2.9	(NA)	.2	(NA)	20.3	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 57 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for the Uranium-Radium-Vanadium Ores Industry.

[3]Excludes data for sand and gravel mining operations in manufacturing establishments.

[4]Includes data for one tropoli mine in Oklahoma. Except, in part, for value of shipments and value added in mining, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing marble at such operations was $108 thousand; this value has been included in the value of shipments and value added in mining. The comparable values for limestone and granite are not available.

[5]Represents number of mines and quarries and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[6]Excludes data for oil and gas extraction and for common clay and shale operations. There were 17 such clay pits in 1939, with products valued at $123 thousand, and operations in the crude petroleum and natural gas industries, with products valued at $59 thousand.

[7]Excludes data for sand, gravel, common clay, and shale operations and for stone quarries operated as parts of cement and lime plants. For 1929, there were 32 such sand and gravel establishments, with products valued at $3,517 thousand; 3 such glass and moulding sand establishments; and 12 such stone operations with products valued at $2,055 thousand.

[8]Excludes data for sand, gravel, common clay, and shale operations. Includes data for one cement plant and for lime plants producing lime valued at $516 thousand.

[9]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[10]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years represents net production and excludes this duplication.

[11]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]For crushed and broken stone, sand and gravel, and clay mining operations in establishments, and for dimension stone mining operations in manufacture in 1958, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy. For 1963 and 1958, the figure for the cost of minerals received for preparation is combined with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[13]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

[14]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to 10 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)

1481	Nonmetallic minerals services	15	-	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees [1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number [1] (1,000)	Payroll [1] (million dollars)	Number [1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	24	6	0.8	4.7	0.8	1.6	4.0	13.7	(D)	17.2	(D)	1.0	14.6
142	Crushed and broken stone (limestone)	10	3	0.3	1.8	0.3	0.6	1.8	9.1	1.3	10.4	(NA)	(NA)	(NA)
144	Sand and gravel	5	1	(Z)	0.2	(Z)	0.1	0.2	0.4	0.2	0.5	(NA)	(Z)	0.6

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963—Continued

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963	
		Establishments[1]		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	Missouri--Continued													
	COUNTIES[2]--Continued													
	Washington county, total.....	9	4	.6	2.7	.5	.9	2.4	6.3	3.1	8.3	1.0	(D)	(D)
10	Metal mining.....	3	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
103	Lead and zinc ores.....	1	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
14	Nonmetallic minerals, except fuels.....	6	3	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
147	Chemical and fertilizer minerals.....	6	3	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

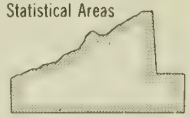
CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:



—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]311	38	5.5	39.4	4.5	9.1	31.0	129.2
1963	[1]416	40	7.6	47.1	6.1	12.6	35.4	111.0
1958	440	39	8.4	44.1	5.8	11.0	27.9	115.9
1954	578	55	11.6	51.6	8.9	17.4	36.8	[2]82.9
Including operations in manufactures:								
1967	323	38	5.5	39.7	4.5	9.2	31.3	131.7
1963	427	40	7.6	47.2	6.1	12.6	35.5	112.1
1958	453	39	8.5	44.3	5.9	11.1	28.0	117.0
1954[3]	583	56	11.6	51.8	8.9	17.5	37.0	[2]83.9
1939[4]	[5]499	(NA)	11.6	17.7	10.3	19.9	14.7	34.9
1919[6]	295	(NA)	17.4	28.7	16.4	(NA)	26.2	37.0
1909[6]	647	(NA)	20.5	23.7	19.6	(NA)	22.2	27.5
1902[7]	[5]410	(NA)	11.7	13.4	[8]11.1	(NA)	12.4	22.9
Excluding oil and gas extraction industries:								
1967	117	16	3.8	27.5	3.2	6.3	21.9	39.4
1963	192	11	5.3	32.9	4.5	8.9	25.6	39.8
1958	221	19	6.3	31.2	4.6	8.5	21.3	46.8
1954[3]	291	27	8.9	38.6	7.0	13.3	28.6	[2]51.1
1939[4]	[5]305	(NA)	10.6	16.3	9.6	18.5	13.6	28.5
1929[9]	205	(NA)	15.9	29.5	15.0	(NA)	26.3	54.1
1919[10]	290	(NA)	17.3	28.7	16.4	(NA)	26.1	36.8

Kind of operation and year	Selected expenses				Value of shipments and receipts[12]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation[11] (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[13]92.6	([13])	18.0	([13])	199.0	40.9	(NA)
1963	35.8	37.4	29.6	42.3	189.5	66.7	2.9
1958	29.7	33.0	17.6	7.5	180.3	23.4	2.9
1954	26.0	35.7	24.1	10.6	[2]147.5	31.7	2.5
Including operations in manufactures:							
1967	[14]110.8	([14])	([14])	([14])	201.5	(NA)	(NA)
1963	[15]36.0	37.4	[15]29.6	[16]42.3	190.7	[16]66.7	[16]2.9
1958	[15]29.8	33.0	[15]17.6	[16]7.5	181.5	[16]23.4	[16]2.9
1954[2]	[15]26.2	35.7	[15]24.1	[16]10.6	[2]148.7	[16]31.7	[16]2.5
1939[3]	9.3	(NA)	0.6	(NA)	44.7	(NA)	1.2
1919[5]	12.7	0.1	0.1	(NA)	49.9	(NA)	[17]2.8
1909[5]	20.4	6.6	0.5	(NA)	55.0	(NA)	(NA)
1902[6]	5.3	(NA)	0.1	(NA)	28.3	(NA)	(NA)
Excluding oil and gas extraction industries:							
1967	[14]18.5	([14])	([14])	([14])	92.4	(NA)	(NA)
1963	[18]20.6	[19]36.4	[15]8.7	[16]31.3	96.9	[16]40.0	[16]1.3
1958	[18]16.5	[19]32.2	[15]2.2	[16]2.3	93.9	[16]6.1	[16]1.3
1954[2]	[15]15.4	35.6	[15]3.8	[16]4.2	[2]103.0	[16]7.1	[16]1.3
1939[3]	8.7	(NA)	0.1	(NA)	37.4	(NA)	0.8
1929[8]	10.8	(NA)	0.3	1.4	65.2	(NA)	1.4
1919[9]	12.6	0.1	0.1	(NA)	49.7	(NA)	[17]2.6

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--Montana--Continued

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 77 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes figures for the Uranium-Radium-Vanadium Ores Industry. No data on value of shipments were obtained for this industry.

[3]Excludes data for sand and gravel mining operations in manufacturing establishments.

[4]Excludes data for dimension stone dressing plants, if any, operated in conjunction with 2 dimension stone quarries. For "All operations" excludes data for one or two oil and gas field hauling operations, with receipts for services amounting to less than $417 thousand; such operations were not classified in the mineral industries after 1939. For "Excluding oil and gas extraction industries" includes data for one natural gas liquids plant.

[5]Represents number of mines and quarries, number of natural gas liquids plants, and for the crude petroleum and natural gas and mining services industries, number of operating companies.

[6]Excludes data for sand and gravel operations. In 1939, there were 7 such mines with products valued at $338 thousand. See also footnote 8. Also, for 1919 and 1909, excludes data for any stone quarries operated as part of cement or lime establishments.

[7]Includes data for lime plants producing lime valued at $9 thousand. See also footnote 5.

[8]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9]Excludes data for common clay and shale operations. There were only 2 such mines in 1939.

[10]Only one nonproducing establishment was reported in the Crude Petroleum and Natural Gas Industry in 1909 and none in 1902. Hence, the figures shown above for "All operations" are essentially comparable with those shown for operations "Excluding oil and gas extraction industries." See also footnote 7.

[11]For years prior to 1958, excludes the cost of natural gas processed at natural gas liquids plants, but for 1954 includes the estimated value prior to processing of natural gas liquids contained in such gas.

[12]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of "Minerals received for preparation." For all other years the figures represent net production and exclude this duplication.

[13]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[15]For crushed and broken stone, sand and gravel, clay and gypsum mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[16]Excludes data for crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments.

[17]Excludes purchased electric energy. For 1939, the quantity of purchased electric energy amounted to 27 percent of the total kw.-hrs. equivalent of energy used; and for the operations shown for 1929, to 23 percent.

[18]Includes the cost of minerals received for preparation in the Nonmetallic Minerals Mining Industries, and for 1963, in the Bituminous Coal Industry. See also footnote 12.

[19]Represents only minerals received in the Metal Mining Industries for 1963 and 1958 and in the Bituminous Coal and Lignite Mining Industries for 1958.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total	With 20 employees or more	Number	Payroll	Number	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	311	38	5.5	39.4	4.5	9.1	31.0	129.2	110.6	199.0	40.9	7.6	111.0

1499	Nonmetallic minerals, n.e.c.	5	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels.....	12	-	(Z)	0.3	(Z)	0.1	0.3	1.5	0.2	1.7	(NA)	(Z)	1.1

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

	Value added in mining..mil.dol..	3.0	(D)	(D)	(D)	-	-	(D)	(D)	(D)	-	-	-	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	311	416	Cost of supplies, total.....million dollars..	110.6	145.2
With 0 to 19 employees.....do....	273	376	Supplies used, minerals received for preparation, and purchased machinery.....do....	86.9	(NA)
With 20 to 99 employees.....do....	30	32	Cost of resales.....do....	0.1	(NA)
With 100 or more employees.....do....	8	8	Purchased fuels consumed.....do....	2.2	(NA)
All employees (average for year).....1,000..	5.5	7.6	Electric energy:		
			Quantity purchased.....million kw.-hrs..	442.1	(NA)
Payroll (all employees), total for year.....million dollars..	39.4	47.1	Cost.....million dollars..	3.3	(NA)
			Generated less sold.....million kw.-hrs..	0.4	(NA)
Production, development, and exploration workers:			Contract work.....million dollars..	18.0	29.6
Average for the year.....1,000..	4.5	6.1	Value of shipments and receipts (including resales), total.....do....	199.0	189.5
March.....do....	6.6	(NA)	Value of resales.....do....	0.3	(NA)
May.....do....	6.1	(NA)			
August.....do....	2.8	(NA)	Value added in mining.....do....	129.2	111.0
November.....do....	2.6	(NA)			
Man-hours.....millions..	9.1	12.6	Capital expenditures (except land and mineral rights), total.....do....	40.9	66.7
Wages.....million dollars..	31.0	35.4	Mineral development and exploration.....do....	12.6	20.1
			New structures and additions.....do....	4.4	} 46.6
Supplemental labor cost not included in payroll.....do..	6.0	(NA)	New machinery and equipment.....do....	23.1	
			Used plant and equipment.....do....	0.8	
Legally required expenditures, including Social Security contributions.....do..	2.6	(NA)	Mineral development and exploration expenditures, total.....do....	20.2	(NA)
Payments for voluntary programs.....do..	3.4	(NA)	Capitalized.....do....	12.6	20.1
			Expensed.....do....	7.6	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963	
		Establishments[1]		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining

	Yellowstone county, total	44	4	0.4	2.7	0.3	0.6	1.7	3.2	4.3	4.8	2.6	0.6	0.5
13	Oil and gas extraction	39	4	0.4	2.6	0.3	0.6	1.7	3.0	(D)	4.7	(D)	0.5	(3)
131	Crude petroleum and natural gas	16	2	0.1	0.9	(Z)	0.1	0.2	1.5	(D)	1.0	(D)	0.4	(3)
138	Oil and gas field services	23	2	0.3	1.7	0.3	0.6	1.4	1.6	(D)	3.7	(D)	0.1	1.2

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

[3] Not shown since cost of supplies, purchased fuels and electricity, contract work, and purchased machinery installed exceed value of shipments and capital expenditures.

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

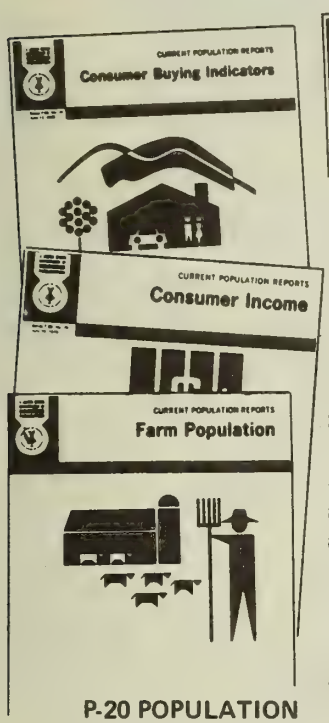
"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.



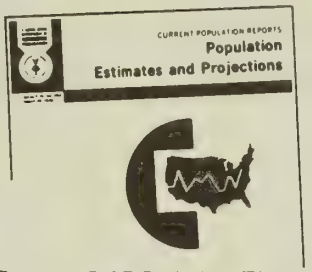
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT POPULATION REPORTS

In addition to the findings of the Census of Population, conducted every ten years, the Bureau of the Census publishes continuing and up-to-date statistics on population counts, characteristics, and other special studies on the American people. Data are issued in the eight separate series of reports described herein and released under the general title, Current Population Reports.



P-20 POPULATION CHARACTERISTICS.

Current national and, in some cases, regional data on geographic residence and mobility, fertility, education, school enrollment, marital status, numbers and characteristics of household and families, etc. Approximately ten reports each year.

P-23 SPECIAL STUDIES.

Infrequent reports on methods, concepts, or specialized data.

P-25 POPULATION ESTIMATES AND PROJECTIONS.

Monthly estimates of the total population of the United States; annual mid-year estimates of the population of States, by broad age groups, and of the United States by age, color, and sex; annual estimates of the components of population change. Estimates of the population selected metropolitan areas and their component counties. Projections of the future population of the United States and individual States. Approximately 20 reports each year.

P-26 FEDERAL-STATE COOPERATIVE PROGRAM FOR POPULATION ESTIMATES.

Population estimates for counties for selected States in which the figures are prepared by a State agency as part of the Federal-State Cooperative Program for Local Population Estimates.

P-27 FARM POPULATION.

(Census-ERS). Data on the size and selected characteristics of the farm population of the United States. Issued jointly with the Economic Research Service, U.S. Department of Agriculture. One or two reports each year.

P-28 SPECIAL CENSUSES.

Results of population censuses taken at the request and expense of city or other local governments. Subscription includes only the quarterly and annual summaries showing the total population figures for all the censuses conducted during the particular period. Individual reports issued for areas of 50,000 or more, showing the population by age, sex, and color are available separately. See "How to Order Reports." Five reports each year.

P-60 CONSUMER INCOME.

Information on the proportions of families and persons at various income levels. Also data on the relationship of income to age, sex, color, family size, education, occupation, work experience, and other characteristics. Two reports each year.

P-65 CONSUMER BUYING INDICATORS.

Information on the proportion of households reporting intentions to purchase automobiles, houses, and household equipment within a particular period of time. Also data on recent purchases. Quarterly.

HOW TO ORDER REPORTS

All Current Population Reports are sold as a single subscription for $14.00 a year. This price includes Series P-20, P-23, P-25, P-26, P-27, P-28 (quarterly and annual summaries only), P-60, and P-65.

Subscriptions to individual series are not sold separately but single copies of reports issued in all series except P-28 may be obtained from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Individual city or area reports in the P-28 series may be ordered from the Bureau of the Census. Prices for these reports vary. For information on titles and prices of individual reports issued in all CPR series, write to Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

From the Bureau of the Census

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*

The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1902	(Z)	(NA)	-	(NA)	.1	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--Nebraska--Continued

Standard Notes: - Represents zero.(D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 42 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments.

[3]Excludes data for dimension stone dressing plants, if any, operated in conjunction with 3 dimension limestone quarries.

[4]Represents number of mines and quarries and, for crude petroleum and natural gas and mining services industries, number of operating companies.

[5]Excludes data for common clay and shale pits and for oil and gas extraction operations, if any. In 1939, there were 8 such clay pits with products valued at $57 thousand, 2 nonproducing operations in the crude petroleum and natural gas industry, and one oil and gas field service operation.

[6]Excludes data for oil and gas extraction operations, if any.

[7]Excludes data for stone quarries operated as parts of cement and lime plants, if any. There was one such quarry in 1929. Also excludes for 1909, data for one nonproducing coal mine.

[8]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years represents net production and excludes this duplication.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]The cost of minerals received for preparation is included with the cost of supplies, purchases for resale, and purchased fuels and electricity.

[13]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14]Excludes data for mining operations in manufacturing establishments.

[15]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to about one-fourth of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total	With 20 employees or more	Number	Payroll	Number	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	254	24	1.6	9.9	1.4	2.8	7.9	43.1	19.8	55.6	7.2	2.1	69.3
13	Oil and gas extraction	113	10	.7	4.2	.6	1.1	3.5	31.3	13.0	38.7	5.6	.9	59.7
1311	Crude petroleum and natural gas	64	3	.3	1.9	.2	.4	1.4	22.9	8.6	28.9	2.5	.4	50.0
	Crude petroleum	63	3	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
138	Oil and gas field services	45	7	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.5	6.2
1381	Drilling oil and gas wells	11	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.2	3.6
1389	Oil and gas field services, n.e.c.	33	6	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.3	2.7
14	Nonmetallic minerals, except fuels	140	14	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
142	Crushed and broken stone	22	5	.3	1.7	.2	.6	1.5	3.8	2.5	5.8	.6	(NA)	(NA)
1422	Crushed and broken limestone	22	5	.3	1.7	.2	.6	1.5	3.8	(D)	5.8	(D)	.3	2.9
144	Sand and gravel	111	8	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.9	8.7
1442	Construction sand and gravel	111	8	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total	With 20 employees or more	Number[1]	Payroll[1]	Number[1]	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	12	1	0.1	0.3	0.1	0.1	0.3	1.6	0.2	1.8	(NA)	0.1	1.3

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments[1]

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	254	370	Cost of supplies, total.....million dollars..	19.8	29.1
With 0 to 19 employees.....do....	230	349	Supplies used, minerals received for preparation, and purchased machinery.....do....	11.8	(NA)
With 20 to 99 employees.....do....	24	21	Cost of resales.....do....	.3	(NA)
With 100 or more employees.....do....	-	-	Purchased fuels consumed.....do....	1.8	(NA)
All employees (average for year).....1,000..	1.6	2.1	Electric energy:		
Payroll (all employees), total for year.....million dollars..	9.9	11.2	Quantity purchased.....million kw.-hrs..	55.8	(NA)
			Cost.....million dollars..	1.1	(NA)
			Generated less sold.....million kw.-hrs..	2.1	(NA)
			Contract work.....million dollars..	4.8	9.7
Production, development, and exploration workers:					
Average for the year.....1,000..	1.4	1.7	Value of shipments and receipts (including resales), total.....do....	55.6	87.8
March.....do....	1.2	(NA)	Value of resales.....do....	.5	(NA)
May.....do....	1.4	(NA)			
August.....do....	1.5	(NA)	Value added in mining.....do....	43.1	69.3
November.....do....	1.4	(NA)			
Man-hours.....millions..	2.8	3.8	Capital expenditures (except land and mineral rights), total.....do....	7.2	10.7
Wages.....million dollars..	7.9	8.6	Mineral development and exploration.....do....	1.1	4.0
			New structures and additions.....do....	2.4	6.6
Supplemental labor cost not included in payroll.....do..	.8	(NA)	New machinery and equipment.....do....	3.1	
			Used plant and equipment.....do....	.6	
			Mineral development and exploration expenditures, total.....do....	1.8	(NA)
Legally required expenditures, including Social Security contributions.....do..	.5	(NA)	Capitalized.....do....	1.1	4.0
Payments for voluntary programs.....do..	.3	(NA)	Expensed.....do....	.7	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963	
		Establishments[1]		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	Nebraska, total	254	24	1.6	9.9	1.4	2.8	7.9	43.1	19.8	55.6	7.2	2.1	69.3
	COUNTIES[2]													
	Cass county, total	8	2	.1	.6	.1	.2	.5	1.6	.8	2.3	.2	.2	1.9
14	Nonmetallic minerals, except fuels	8	2	.1	.6	.1	.2	.5	1.6	.8	2.3	.2	.2	1.9
	Douglas county, total	15	4	.2	1.1	.1	.2	.7	1.7	1.1	2.5	.3	.1	1.2
14	Nonmetallic minerals, except fuels	11	4	.2	1.1	.1	.2	.7	1.7	1.1	2.5	.3	(D)	(D)
144	Sand and gravel	9	3	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
	Kimball county, total	63	5	.3	2.2	.3	.6	1.9	11.6	3.9	12.3	3.3	.3	16.0
13	Oil and gas extraction	63	5	.3	2.2	.3	.6	1.9	11.6	3.9	12.3	3.3	.3	16.0
138	Oil and gas field services	29	4	.2	1.5	.2	.5	1.3	3.2	1.4	3.9	.7	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 60 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for the Uranium-Radium-Vanadium Ores Industry.

[3]Excludes data for sand and gravel mining operations in manufacturing establishments, if any.

[4]Represents number of mines and quarries and, for mining services industries, number of operating companies.

[5]Excludes data for common clay and shale mining operations, if any. Only one such operation was reported for 1939.

[6]Excludes data for sand and gravel mining operations and stone quarries operated as parts of lime plants. For 1929, 3 sand and gravel mining operations were reported and one such stone quarry. See also footnote 5.

[7]May include data for one lime plant producing lime valued at less than $73 thousand.

[8]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9]For crushed and broken stone, sand and gravel, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1939 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. For all other years represents net production and excludes this duplication.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]Figure for minerals received for preparation are included with those for supplies, purchases for resale, and purchased fuels and electric energy.

[12]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13]For crushed and broken stone, sand and gravel, and gypsum mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14]Excludes data for crushed and broken stone, sand and gravel, and gypsum mining operations in manufacturing establishments, and, for 1963, data for dimension stone quarries in manufacturing establishments.

[15]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 4 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total	With 20 employees or more	Number	Payroll	Number	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees [1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number [1] (1,000)	Payroll [1] (million dollars)	Number [1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	7	-	0.1	0.5	0.1	0.1	0.5	2.5	0.3	2.8	(NA)	0.2	5.1

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

102	Copper ores	2	2	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)
Nevada, total	131	72	-	-	15	44
0 to 4 employees	69	38	-	-	12	19
5 to 9 employees	23	15	-	-	-	8
10 to 19 employees	18	6	-	-	2	10
20 to 49 employees	9	4	-	-	1	4

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

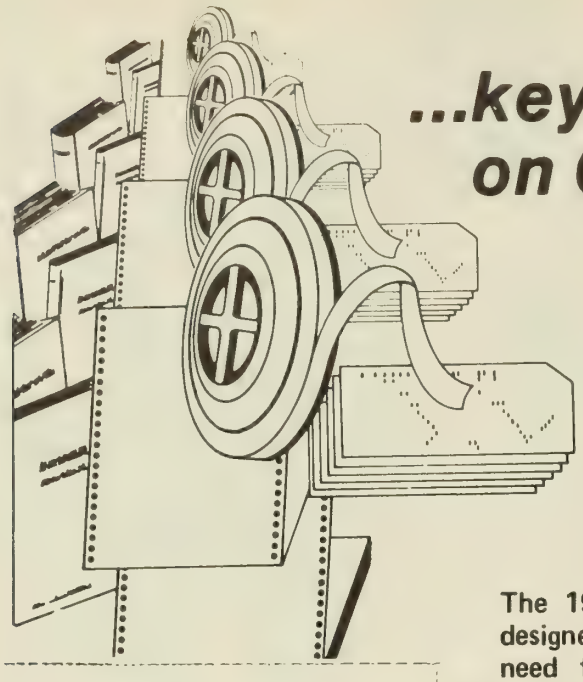
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

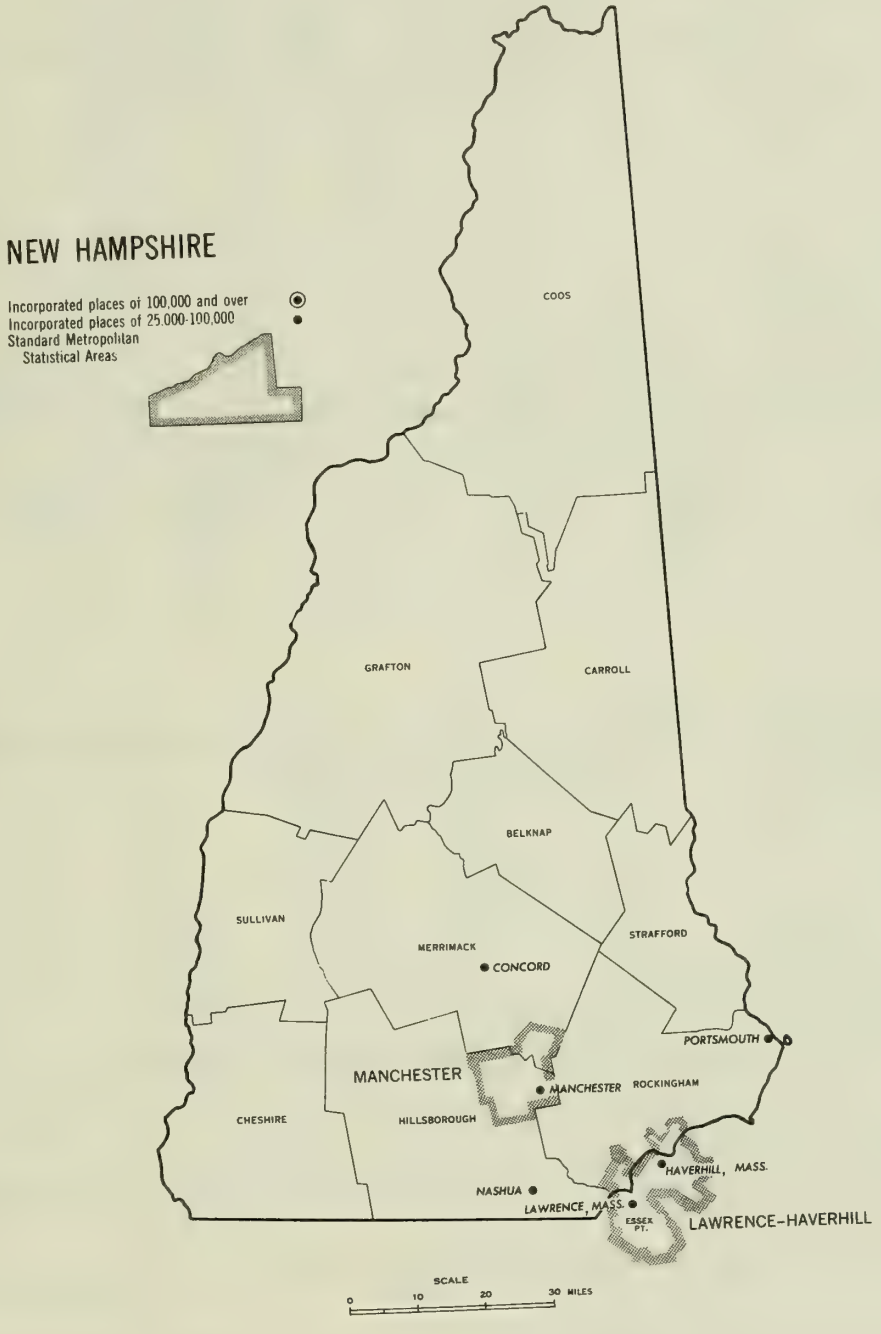
In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:



NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]26	3	.2	1.4	.2	.4	1.1	3.3
1963	[1]32	3	.2	1.2	.2	.4	.9	2.2
1958	38	3	.2	1.0	.2	.4	.7	2.0
1954	39	3	.3	.9	.2	.5	.7	1.7
Including operations in manufactures:								
1967	29	4	(D)	(D)	(D)	(D)	(D)	(D)
1963	39	4	(D)	(D)	(D)	(D)	(D)	(D)
1958	45	4	.3	1.5	.3	.6	1.2	2.8
1954[2]	44	4	.3	1.1	.3	.6	.9	1.9
1939[3]	[4]25	(NA)	.3	.4	.3	.5	.3	.8
1929[5]	36	(NA)	.6	.9	.6	(NA)	.8	1.3
1919[6]	30	(NA)	.7	.9	.7	(NA)	.8	1.3
1909[6]	46	(NA)	1.5	1.0	1.4	(NA)	.9	1.1
1902[7]	[4]56	(NA)	1.3	.9	[8]1.3	(NA)	.8	1.0

Kind of operation and year	Selected expenses				Value of shipments and receipts[9]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[10]1.3	([10])	.3	([10])	4.2	.8	(NA)
1963	.9	-	.2	.3	3.1	.5	(Z)
1958	.6	.1	.2	.2	2.9	.2	(Z)
1954	.3	.5	.1	.2	2.0	.3	(Z)
Including operations in manufactures:							
1967	(D)	(D)	(D)	(D)	(D)	(D)	(NA)
1963	(D)	(D)	(D)	(D)	(D)	(D)	(NA)
1958	[11].8	.1	[11].2	[12].2	3.9	[12].2	[12](Z)
1954[2]	[11].6	.1	[11].1	[12].2	2.5	[12].3	[12](Z)
1939[3]	.1	(NA)	-	(NA)	.9	(NA)	(Z)
1929[5]	.3	(NA)	(Z)	(Z)	1.6	(NA)	.1
1919[6]	.2	(NA)	(Z)	(NA)	1.6	(NA)	[13](Z)
1909[6]	.2	-	(Z)	(NA)	1.3	(NA)	(NA)
1902[7]	.1	-	-	(NA)	1.2	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable. (Z) Represents less than one-half of the unit of measure specified.

[1]In 1967, for the first time, data for single unit establishments without paid employees were excluded from the census. In 1963, there was 1 single unit establishment without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments, if any.

[3]Except for value of shipments and value added, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing stone at such operations was $250 thousand; this value has been included in the value of shipments and value added in mining. Except for number of mines and quarries, includes data for one diatomite mine in Massachusetts.

[4]Represents number of mines and quarries.

[5]Excludes data for common clay and shale operations. There were 3 such mines in 1939, with products valued at $11 thousand.

[6]Excludes data for sand and gravel operations. There were 4 such establishments in 1929, with products valued at less than $387 thousand. See also footnote 5.

[7]Excludes data for one nonproducing operation. See also footnote 6.

[8]Figures for average employment were converted to a 300-day basis for establishments, which operated for a shorter period.

[9]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments and for dimension stone operations in manufactures in 1958, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[12]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, and for 1958, for dimension stone operations in manufactures.

[13]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 6 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]....	26	3	.2	1.4	.2	.4	1.1	3.3	1.6	4.2	.8	.2	2.2
14	Nonmetallic minerals, except fuels.....	26	3	.2	1.4	.2	.4	1.1	3.3	1.6	4.2	.8	.2	2.2
144	Sand and gravel.....	20	2	.2	.9	.1	.3	.7	2.2	.9	2.6	.5	.2	1.2
1442	Construction sand and gravel.....	20	2	.2	.9	.1	.3	.7	2.2	.9	2.6	.5	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels.....	3	1	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

Standard Notes: - Represents zero.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

–	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]138	45	2.9	22.1	2.1	4.6	13.6	50.6
1963	[1]157	47	3.8	23.8	2.9	6.4	16.6	55.2
1958	135	42	3.7	19.5	2.8	5.6	13.4	37.6
1954	153	41	4.1	18.5	3.5	7.8	14.9	[2]38.6
Including operations in manufactures:								
1967	147	45	2.9	22.3	2.1	4.7	13.8	51.3
1963	182	49	4.1	25.4	3.2	7.0	18.1	59.4
1958	150	44	3.9	20.0	2.9	5.8	13.8	40.7
1954[3]	166	41	4.2	18.8	3.5	7.9	15.2	[2]39.0
1939[4]	[5]137	(NA)	4.0	5.9	3.4	6.5	4.3	11.1
1929[6]	117	(NA)	4.2	6.9	3.6	(NA)	5.4	12.5
Excluding sand, gravel, common clay, and shale operations:								
1967	54	21	(D)	(D)	(D)	(D)	(D)	(D)
1929	65	(NA)	3.3	5.4	2.9	(NA)	4.3	8.8
1919	97	(NA)	5.0	6.1	4.6	(NA)	5.4	6.3
1909	133	(NA)	6.6	3.1	6.3	(NA)	2.8	7.3
1902[7]	[5]165	(NA)	6.4	3.3	[8]6.0	(NA)	2.8	4.4

Kind of operation and year	Selected expenses				Value of shipments and receipts[9]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[10]23.9	([10])	2.0	([10])	70.1	6.4	(NA)
1963	18.8	.6	.7	5.1	72.4	8.2	1.0

1958	[12]12.0	.1	[12].8	[13]2.3	50.0	[13]3.9	[13].7
1954[3]	[12]11.3	.5	[12]1.3	[13]3.5	[2]51.5	[13]4.0	[13].7
1939[4]	2.9	(NA)	.1	(NA)	14.1	(NA)	.7
1929[6]	3.1	(NA)	.1	823	15.8	(NA)	.9
Excluding sand, gravel, common clay, and shale operations:							
1967	(D)	(D)	(D)	(D)	(D)	(D)	(NA)
1929	2.2	(NA)	.1	.5	11.1	(NA)	.7
1919	2.9	-	.1	(NA)	9.3	(NA)	[14]1.0
1909	1.0	-	(Z)	(NA)	8.3	(NA)	(NA)
1902[7]	2.2	(NA)	(Z)	(NA)	6.6	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 8 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2] Excludes figures for the Uranium-Radium-Vanadium Ores Industry. No data on value of shipments and cost of ores received for milling were obtained for this industry for 1954.

[3] Excludes figures for sand and gravel mining operations in manufacturing establishments.

[4] Except for number of mines, excludes data for nonproducing operation as follows: 1 iron ore mine and 1 trap rock quarry and crushing plant. Also excludes figures for dimension stone dressing plants operated in conjunction with quarries, if any.

[5] Represents number of mines and quarries.

[6] Excludes figures for common clay and shale and peat operations. There were 12 common clay and shale mines in 1939 with products valued at $202 thousand.

[7] Includes figures for lime plants producing lime valued at $123 thousand. Also includes data for 2 cement plants.

[8] Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9] For sand and gravel and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contain some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For years prior to 1958, the figures represent net production and exclude this duplication.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--New Jersey--Continued

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.
[11]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.
[12]For stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.
[13]Excludes figures for stone, sand and gravel, and clay mining operations in manufacturing establishments.
[14]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 2 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All[1] employees	Value added in mining
		Total	With 20 employees or more	Number	Payroll[1]	Number	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	9	-	(Z)	0.2	(Z)	0.1	0.2	0.7	0.1	0.8	(NA)	0.3	4.2

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]	
				Total	Underground mines	Open-pit mines	Combination methods, well operations, and other methods	Total	Underground mines	Open-pit mines	Combination methods and other methods

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

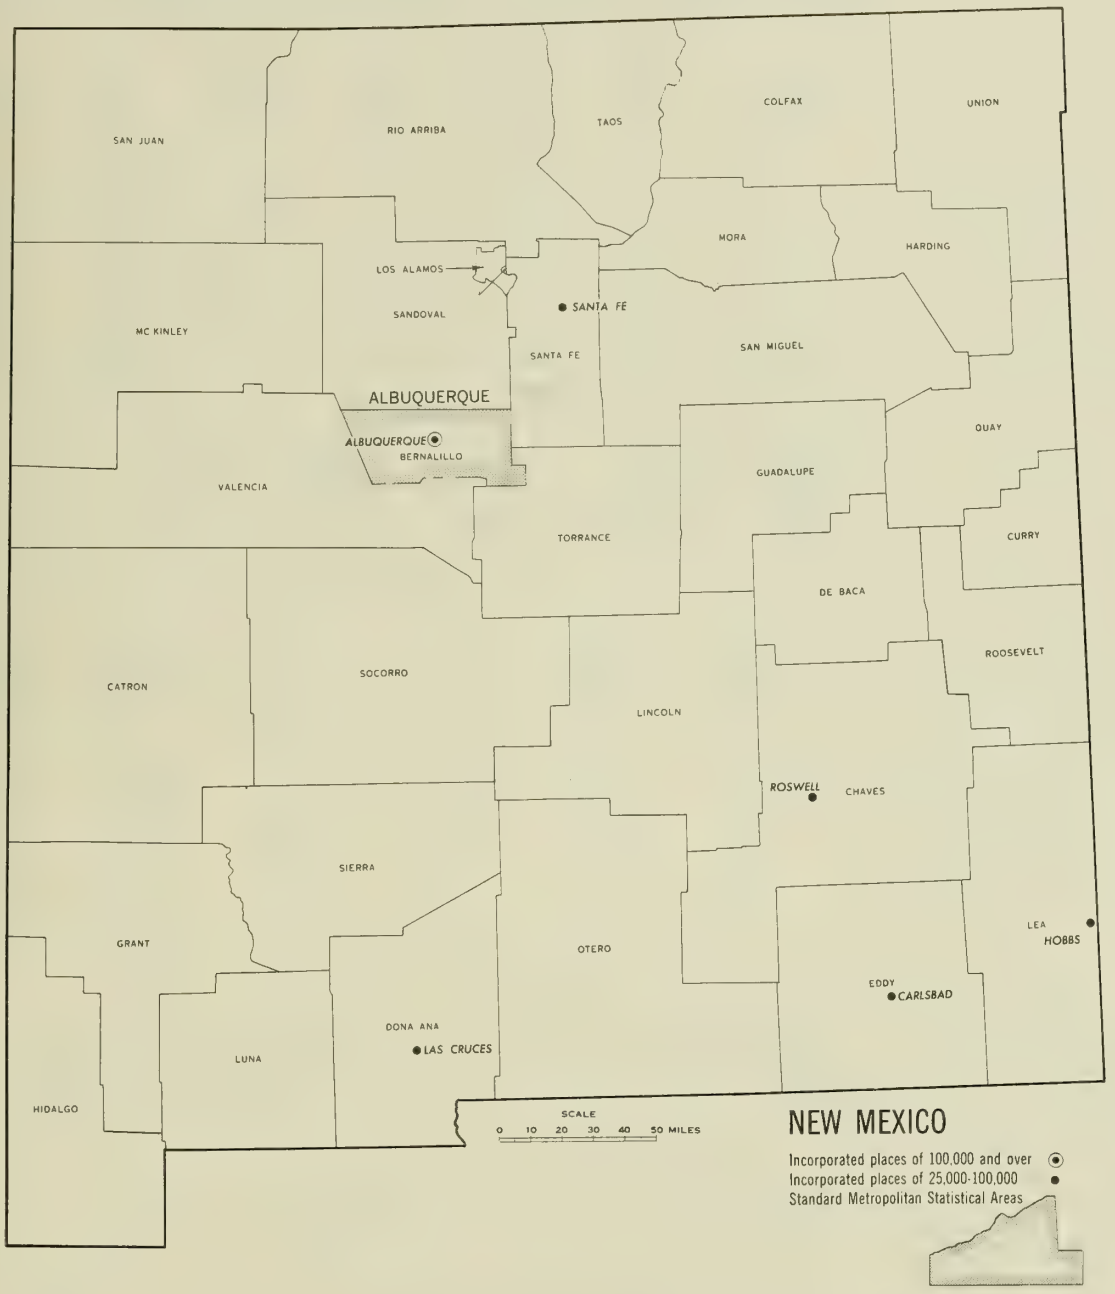
In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:



NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]690	156	16.6	120.7	13.0	26.6	90.2	718.8
1963	[2]865	[2]149	17.6	114.6	13.8	28.0	85.4	649.6
1958	761	142	17.5	97.2	13.5	28.1	70.1	532.0
1954	691	119	13.9	65.8	11.5	23.6	51.3	[3]338.1
Including operations in manufactures:								
1967	700	.57	16.7	121.1	13.1	26.7	90.6	719.9
1963	[2]881	[2]151	17.3	115.3	13.1	28.2	86.1	653.2
1958	770	142	17.6	97.5	13.6	28.2	70.4	534.1
1954 [4]	693	119	13.9	65.8	11.5	23.6	51.3	[3]338.1
1939 [5]	[6]286	(NA)	8.9	12.7	8.1	14.8	10.6	44.7
1929 [7]	93	(NA)	7.6	11.6	7.1	(NA)	10.3	20.9
1919 [8]	103	(NA)	7.7	11.9	7.2	(NA)	10.7	13.4
1909 [8]	154	(NA)	5.8	4.3	5.4	(NA)	3.8	4.2
1902 [8]	[6]320	(NA)	2.9	2.2	[9]2.6	(NA)	1.9	1.9

Kind of operation and year	Selected expenses				Value of shipments and receipts[11] (million dollars)	Capital expenditures (million dollars)	Energy used (kw.-hrs. equivalent) (billions)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation[10] (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)			
Mineral industries only:		([12])		([12])			
1967	[12]403.1	134.8	74.4	39.2	1,034.4	161.9	(NA)
1963	118.9	134.8	84.8	39.2	876.9	150.4	22.5
1958	119.8	89.9	139.3	47.8	704.6	224.2	19.4
1954	67.9	5.8	72.6	41.0	[3]403.3	121.7	12.4
Including operations in manufactures:							
1967	[13]477.9	([13])	([13])	([13])	1,036.6	(NA)	(NA)
1963	[14]119.5	134.8	[14]84.8	[15]39.2	881.1	[15]150.4	[15]22.5
1958	[14]120.1	89.9	[14]139.3	[15]47.8	707.1	[15]224.2	[15]19.4
1954 [3]	[14]67.9	5.8	[14]72.6	[15]41.0	[3]403.3	[15]121.7	[15]12.4
1939 [4]	7.0	(NA)	7.5	(NA)	59.2	(NA)	9.2
1929 [6]	6.1	(NA)	.1	1.2	27.1	(NA)	1.9
1919 [7]	5.4	(Z)	.1	(NA)	18.9	(NA)	[16]1.9
1909 [7]	1.2	-	.2	(NA)	5.6	(NA)	(NA)
1902 [7]	.6	(NA)	.1	(NA)	2.7	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 104 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Figures for number of establishments in 1963 are not entirely comparable with those for earlier years. For 1963, operators of oil and gas field properties were asked to make separate reports by districts for East and West New Mexico, whereas only one report was required for the State in previous years.

[3]Excludes data for the Uranium-Radium-Vanadium Ores Industry.

[4]Except for number of establishments, excludes data for 2 operations in manufacturing establishments.

[5]Includes data for 4 or less service establishments engaged in oil and gas field machine shop work. Such establishments were not classified in the mineral industries in 1954 and 1958.

[6]Represents number of mines and quarries, number of natural gas liquids plants, and for the crude petroleum and natural gas mining services industries, number of operating companies.

[7]Excludes the oil and gas extraction industries; in 1939, there were about 179 operations reported in these industries with value of shipments and receipts amounting to about $37,649 thousand, but only one establishment was reported in these industries in 1919. Also, excludes common clay and shale operations; there were 4 such operations in 1939, with products valued at $422 thousand.

[8]Excludes data for sand, gravel, common clay, and shale operations. For 1929, only one producing sand and gravel establishment was reported.

[9]Figures for average employment were reduced to a 300-day basis for establishments which operated for a shorter period.

[10]For years prior to 1958, excludes the cost of natural gas processed at natural gas liquids plants, but for 1954, includes the estimate value prior to processing of natural gas liquids contained in such gas.

[11]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, the figures represent net production and exclude this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[12]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for Table 1. New Mexico--Continued

[13]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments and for 1963 for dimension stone mines in manufacturing establishments, cost of contract work is included with cost of supplies, purchases for resale, and purchased fuels and electric energy.

[15]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, and for 1963, excludes data for dimension stone mines in manufacturing establishments.

[16]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 0.9 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	690	156	16.6	120.7	13.0	26.6	90.2	718.8	477.5	1,034.4	161.9	17.6	649.6

1499	Nonmetallic minerals, n.e.c.	5	2	BB	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	10	1	0.1	0.4	0.1	0.1	0.4	1.8	0.4	2.2	(NA)	0.1	3.7
144	Sand and gravel	4	1	(Z)	0.2	(Z)	0.1	0.2	0.6	0.3	0.9	(NA)	0.1	2.5

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments											Nonproducing establishments

	Employees.....1,000..	.1	.1	(D)	-	(D)	-	(D)	-	(D)	-	-	-	-
	Value added in mining..mil.dol..	3.8	3.8	(D)	-	(D)	-	(D)	-	(D)	-	-	-	-

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.
[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	690	865	Cost of supplies, total.....million dollars..	477.5	377.8
With 0 to 19 employees.....do....	534	716	Supplies used, minerals received for preparation, and purchased machinery.....do....	379.9	(NA)
With 20 to 99 employees.....do....	124	117	Cost of resales.....do....	.7	(NA)
With 100 or more employees.....do....	32	32	Purchased fuels consumed.....do....	11.4	(NA)
All employees (average for year).....1,000..	16.6	17.6	Electric energy:		
Payroll (all employees), total for year.....million dollars..	120.7	114.6	Quantity purchased.....million kw.-hrs..	944.7	(NA)
Production, development, and exploration workers:			Cost.....million dollars..	11.1	(NA)
Average for the year.....1,000..	13.0	13.8	Generated less sold.....million kw.-hrs..	456.1	(NA)
March.....do....	13.4	(NA)	Contract work.....million dollars..	74.4	84.8
May.....do....	13.5	(NA)	Value of shipments and receipts (including resales), total.....do....	1,034.4	876.9
August.....do....	13.1	(NA)	Value of resales.....do....	.9	
November.....do....	12.2	(NA)	Value added in mining.....do....	718.8	649.6
Man-hours.....millions..	26.6	28.0	Capital expenditures (except land and mineral rights), total.....do....	161.9	150.4
Wages.....million dollars..	90.2	85.4	Mineral development and exploration.....do....	66.9	67.7
Supplemental labor cost not included in payroll.....do..	13.5	(NA)	New structures and additions.....do....	22.3	82.7
Legally required expenditures, including Social Security contributions.....do..	6.7	(NA)	New machinery and equipment.....do....	69.4	
Payments for voluntary programs.....do..	6.8	(NA)	Used plant and equipment.....do....	3.3	
			Mineral development and exploration expenditures, total.....do....	83.9	(NA)
			Capitalized.....do....	66.9	67.7
			Expensed.....do....	17.0	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

109	Miscellaneous metal ores....	5	4	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees

[1]See table 5, footnote 1.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

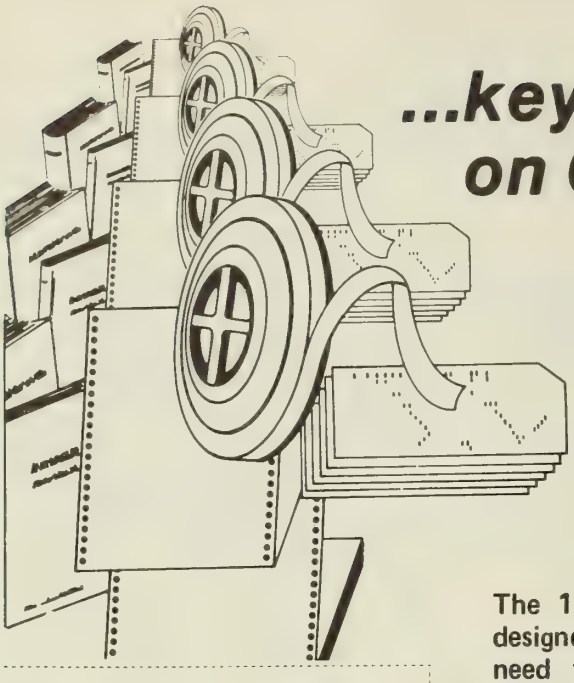
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

U.S. DEPARTMENT OF COMMERCE/Bureau of the Census

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

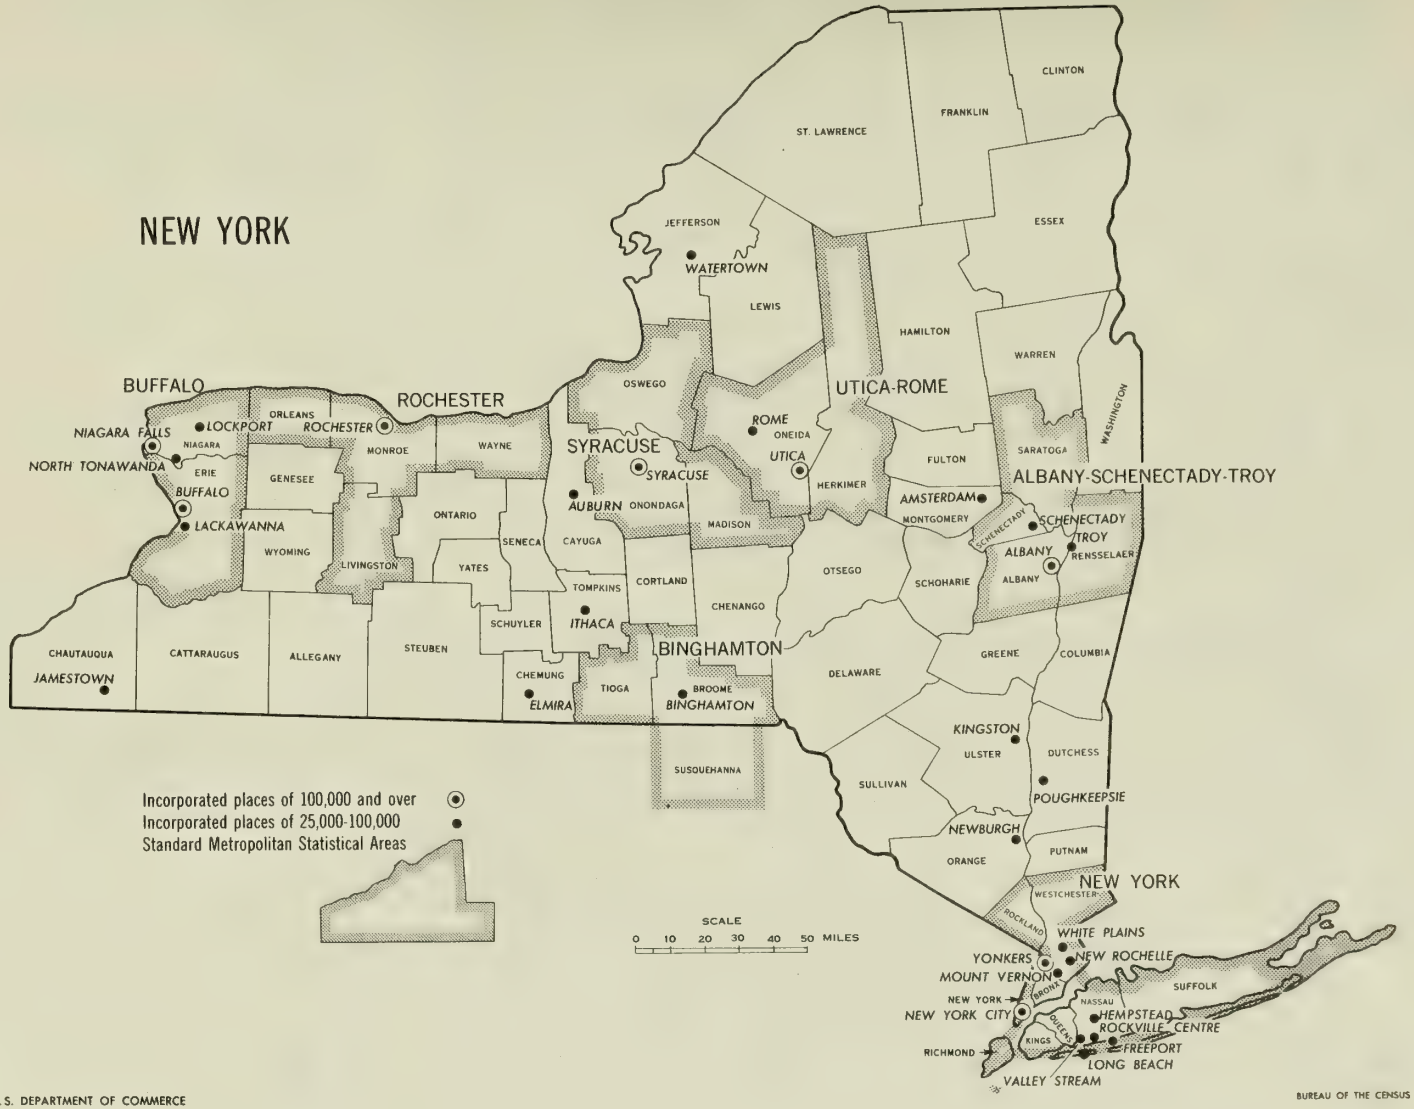
Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST
- New England
- Middle Atlantic

NORTH CENTRAL
- East North Central
- West North Central

SOUTH
- South Atlantic
- East South Central
- West South Central



WEST
- Mountain
- Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]467	87	9.1	81.7	5.9	12.6	43.0	137.5
1963	[1]518	69	9.9	71.2	6.6	13.9	41.3	129.7
1958	543	69	9.7	57.0	6.4	13.6	34.0	116.0
1954	629	68	11.5	62.9	7.6	16.9	35.2	96.8
Including operations in manufactures:								
1967	517	94	9.6	84.7	6.4	13.6	45.9	148.6
1963	590	79	10.7	75.1	7.4	15.5	45.2	141.8
1958	622	82	10.5	60.5	7.2	15.1	37.4	129.6
1954[2]	694	80	12.4	66.3	8.5	18.6	38.5	104.7
1939[3]	[4]518	(NA)	8.7	15.4	7.0	14.7	9.7	32.8
Excluding oil and gas extraction industries:								
1967	381	82	8.8	77.0	6.0	12.7	43.7	138.5
1963	400	73	9.6	68.2	6.8	14.1	41.9	132.2
1958	387	75	9.4	54.5	6.5	13.8	34.8	122.1

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

(See appendix, Explanation of Terms)

Kind of operation and year	Selected expenses				Value of shipments and receipts (million dollars)	Capital expenditures (million dollars)	Energy used (kw.-hrs. equivalent) (billions)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)			
Excluding sand, gravel, common clay, and shale operations and stone quarries operated as parts of cement and lime plants:							
1967	42.4	([13])	([13])	([13])	153.2	(NA)	(NA)
1963	30.4	3.1	[14]4.0	[15]6.7	139.2	[15]12.8	[15]2.6
1958	[7]25.8	4.9	[14]3.2	[15]4.4	[7]124.5	[15]10.7	[15]2.4
1954	[14]23.3	.3	[14]4.1	[15]9.7	104.7	[15]10.6	[15]3.1
1939[8]	5.4	(NA)	1.4	(NA)	31.9	(NA)	(NA)
1919	6.1	2.7	.8	(NA)	25.1	(NA)	[16]1.4
1909	2.5	.1	.5	(NA)	13.3	(NA)	(NA)
1902[9]	1.6	(NA)	.4	(NA)	9.7	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 73 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes figures for sand and gravel mining operations in manufacturing establishments.

[3]Except, in part, for value of shipments and value added, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing sandstone and slate at such operations was $78 thousand; this value has been included in the value of shipments and value added in mining. The comparable value for granite is not available.

[4]Represents number of mines and quarries and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[5]Includes figures for one natural gas liquids plant and 4 nonproducing crude petroleum and natural gas establishments. See also footnote 6.

[6]Excludes figures for common clay and shale mining operations. In 1939, there were 34 such mines with products valued at $420 thousand. Also excludes data for 2 nonproducing establishments.

[7]Includes figures for 24 sand and gravel mining operations in manufacturing establishments with products valued at less than $3 million.

[8]Includes figures for 4 or less limestone quarries operated as parts of lime plants and for one nonproducing sand and gravel establishment. See also footnote 5.

[9]Includes figures for lime plants producing lime valued at $561 thousand.

[10]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[11]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication.

[12]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy. For energy used and horsepower in 1963, also excludes figures for dimension stone operations in manufactures.

[15]Excludes figures for crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments.

[16]Excludes purchased electric energy. For such operations in 1954, the quantity of purchased electric energy amounted to only 9 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	467	87	9.1	81.7	5.9	12.6	43.0	137.5	53.7	175.5	15.7	9.9	129.7

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	50	7	0.5	3.0	0.5	1.0	2.9	11.1	2.7	13.8	(NA)	0.8	12.0
142	Crushed and broken stone	8	4	0.1	1.0	0.1	0.3	1.0	3.4	1.4	4.7	(NA)	0.2	3.8
144	Sand and gravel	22	-	0.1	0.5	0.1	0.2	0.5	4.6	0.5	5.1	(NA)	0.2	4.7
1492	Gypsum	4	1	0.1	0.5	0.1	0.2	0.5	1.6	0.4	2.0	(NA)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

149	Miscellaneous nonmetallic minerals	1	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
	Westchester county, total	13	2	.1	.7	.1	.2	.5	.9	.3	1.1	.1	.1	.6

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1909[7]	.3	-	(Z)	(NA)	1.4	(NA)	(NA)
1902[8]	.2	(NA)	(Z)	(NA)	.9	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 18 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes figures for the Uranium-Radium-Vanadium Ores Industry.

[3]All figures except number of establishments exclude data for one fire clay mining operation in a manufacturing plant. Also excludes data for sand and gravel mining operations in manufacturing establishments.

[4]Except, in part, for value of shipments and value added, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing granite at such operations was $280 thousand; this value has been included in the value of shipments and value added in mining. The comparable values for sandstone and marble are not available.

[5]Represents number of mines and quarries.

[6]Excludes data for common clay and shale mining operations. In 1939, there were 23 such mines with products valued at $184 thousand.

[7]Excludes data for sand and gravel mining operations. In 1929, there were 6 such establishments, with products valued at $350 thousand. See also footnote 6. For 1919, also excludes data for 2 nonproducing establishments.

[8]Includes data for lime plants producing lime valued at $2 thousand.

[9]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[10]For sand and gravel and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For all other years, represents net production and excludes this duplication.

[11]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]Figures for the cost of minerals received for preparation are included with those for t of supplies, purchases for resale, and purchased fuels and electric energy.

[13]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14]For sand and gravel and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[15]Excludes data for sand and gravel and clay mining operations in manufacturing establishments.

[16]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 3 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)

1496	Talc, soapstone, and pyrophillite	8	3	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	29	3	0.5	2.0	0.5	0.9	1.8	6.1	1.5	7.6	(NA)	0.5	3.6
145	Clay and related minerals, n.e.c	24	-	0.1	0.4	0.1	0.2	0.4	3.1	0.5	3.6	(Z)	0.1	1.5

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments											Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963
Establishments, total.....number..	161	169
With 0 to 19 employees.....do....	102	123
With 20 to 99 employees.....do....	56	46
With 100 or more employees.....do....	3	-
All employees (average for year).....1,000..	3.5	2.6
Payroll (all employees), total for year.....million dollars..	18.8	10.9
Production, development, and exploration workers:		
Average for the year.....1,000..	2.9	2.3
March.....do....	2.9	(NA)
May.....do....	3.0	(NA)
August.....do....	3.0	(NA)
November.....do....	2.8	(NA)
Man-hours.....millions..	6.7	5.0
Wages.....million dollars..	14.4	8.7
Supplemental labor cost not included in payroll.....do..	1.8	(NA)
Legally required expenditures, including Social Security contributions.....do..	1.0	(NA)
Payments for voluntary programs.....do..	.8	(NA)

Item	1967	1963
Cost of supplies, total.....million dollars..	29.5	11.6
Supplies used, minerals received for preparation, and purchased machinery.....do....	22.7	(NA)
Cost of resales.....do....	.2	(NA)
Purchased fuels consumed.....do....	2.4	(NA)
Electric energy:		
Quantity purchased.....million kw.-hrs..	217.6	(NA)
Cost.....million dollars..	2.4	(NA)
Generated less sold.....million kw.-hrs..	.1	(NA)
Contract work.....million dollars..	1.9	1.7
Value of shipments and receipts (including resales), total.....do....	67.4	44.4
Value of resales.....do....	.2	(NA)
Value added in mining.....do....	46.7	31.6
Capital expenditures (except land and mineral rights), total.....do....	8.8	4.5
Mineral development and exploration.....do....	.5	1.0
New structures and additions.....do....	1.0	3.5
New machinery and equipment.....do....	6.3	
Used plant and equipment.....do....	1.0	
Mineral development and exploration expenditures, total.....do....	.5	(NA)
Capitalized.....do....	.5	1.0
Expensed.....do....	(Z)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963	
		Establishments[1]		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining

142	Crushed and broken stone	5	3	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

[1]See table 5, footnote 1.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

6	Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967	7
APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST
- New England
- Middle Atlantic

NORTH CENTRAL
- East North Central
- West North Central

SOUTH
- South Atlantic
- East South Central
- West South Central

WEST
- Mountain
- Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1939[4]	.5	(NA)	(Z)	(NA)	2.5	(NA)	.2
1929[6]	.5	(NA)	(Z)	.1	3.2	(NA)	[14] .3
1919	.3	-	(Z)	(NA)	1.9	(NA)	.1
1909	.1	-	(Z)	(NA)	.6	(NA)	(NA)
1902[7]	.1	(NA)	(Z)	(NA)	.3	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 33 single unit establishments without paid employees in this State. In 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2] Excludes data for the Uranium-Radium-Vanadium Ores Industry.

[3] Except for number of establishments, excludes data for one clay mining operation in a manufacturing establishment. Excludes data for any sand and gravel mining operations in manufacturing establishments.

[4] Except for number of establishments, excludes data for one mining services establishment and one nonproducing establishment.

[5] Represents number of mines and quarries and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[6] Excludes data for one sand and gravel establishment, and for common clay and shale and oil and gas extraction operations, if any.

[7] Includes data for one cement plant.

[8] Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9] For sand and gravel and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[10] Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11] The cost of minerals received for preparation is included with the cost of supplies, purchases for resale, and purchased fuels and electricity. However for 1954, excludes the cost of natural gas processed at natural gas liquids plants but includes the value prior to processing of natural gas liquids contained in such gas.

[12] For sand and gravel and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[13] Excludes data for sand and gravel and clay mining operations in manufacturing establishments.

[14] Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only one percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	166	24	1.9	12.6	1.6	3.3	10.1	76.9	45.5	102.8	19.6	1.7	73.7

13	Oil and gas extraction	105	16	1.3	8.9	1.1	2.1	7.0	67.6	37.7	87.8	17.5	1.1	67.2
131	Crude petroleum and natural gas	68	3	.5	3.3	.3	.6	2.1	51.8	26.8	63.3	15.4	.4	55.0
1312	Crude petroleum	57	3	.5	3.3	.3	.6	2.0	51.8	26.8	63.3	15.4	(D)	(D)
1321	Natural gas liquids	3	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
138	Oil and gas field services	44	12	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1381	Drilling oil and gas wells	9	3	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.2	3.5
1389	Oil and gas field services, n.e.c.	31	9	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
14	Nonmetallic minerals, except fuels	27	3	.3	1.6	.2	.5	1.4	3.7	2.5	5.4	.8	(NA)	(NA)
144	Sand and gravel	25	3	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.2	2.6
1442	Construction sand and gravel	25	3	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

Standard Notes: - Represents zero.
[1]See table 5 footnote 1.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

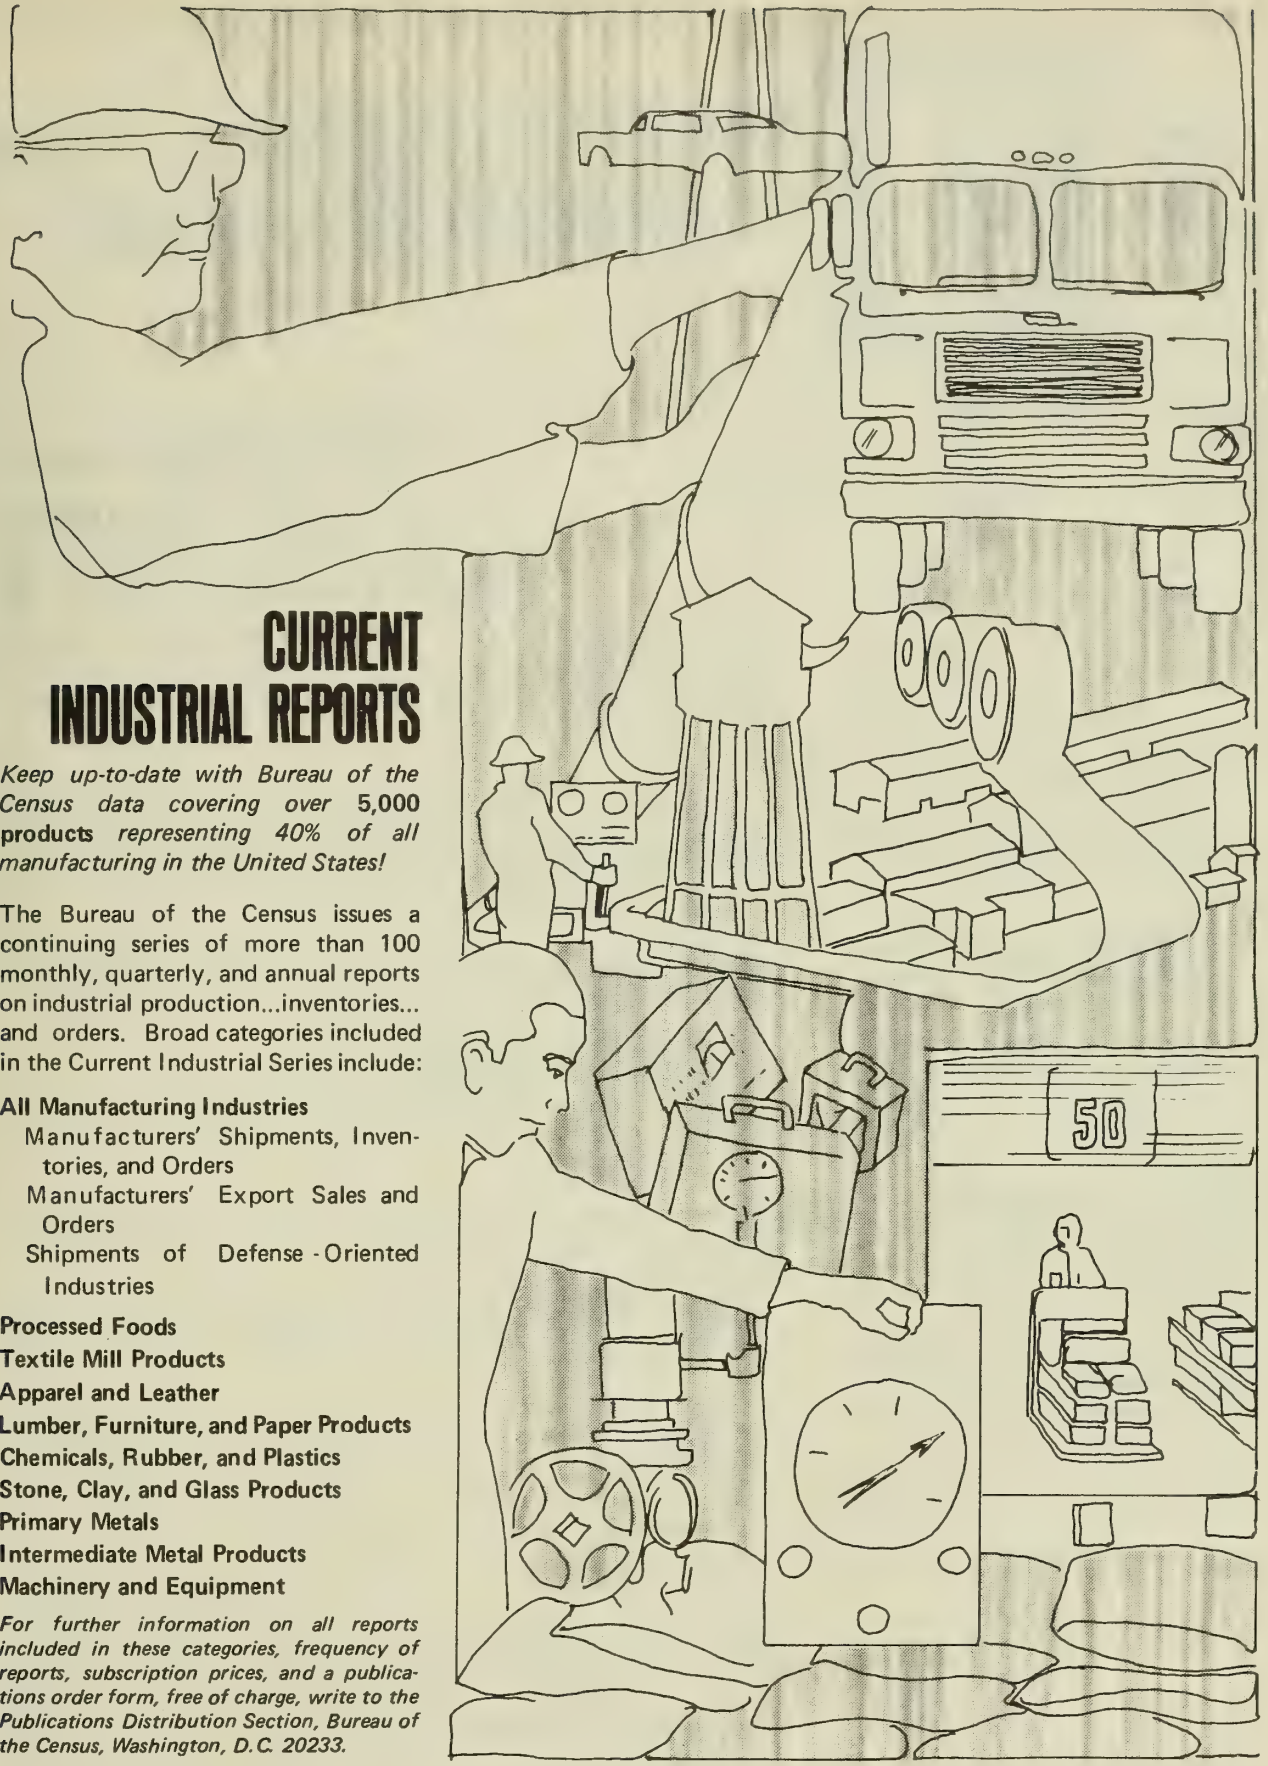
Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.



For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

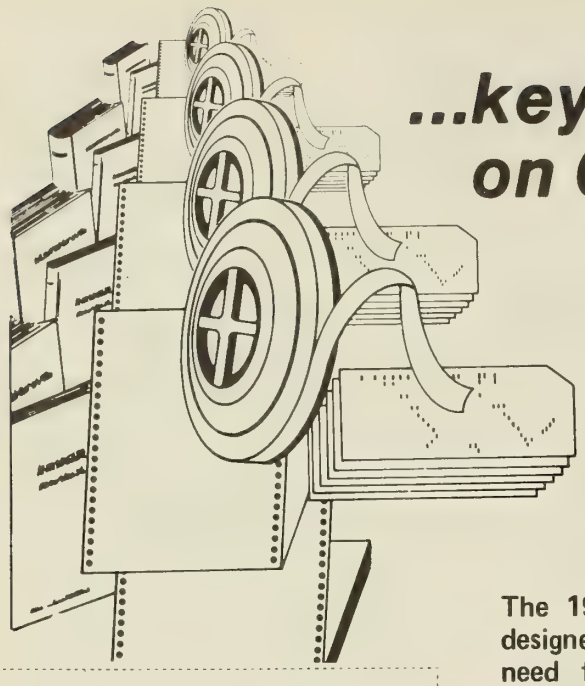
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

6	Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967	12
APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

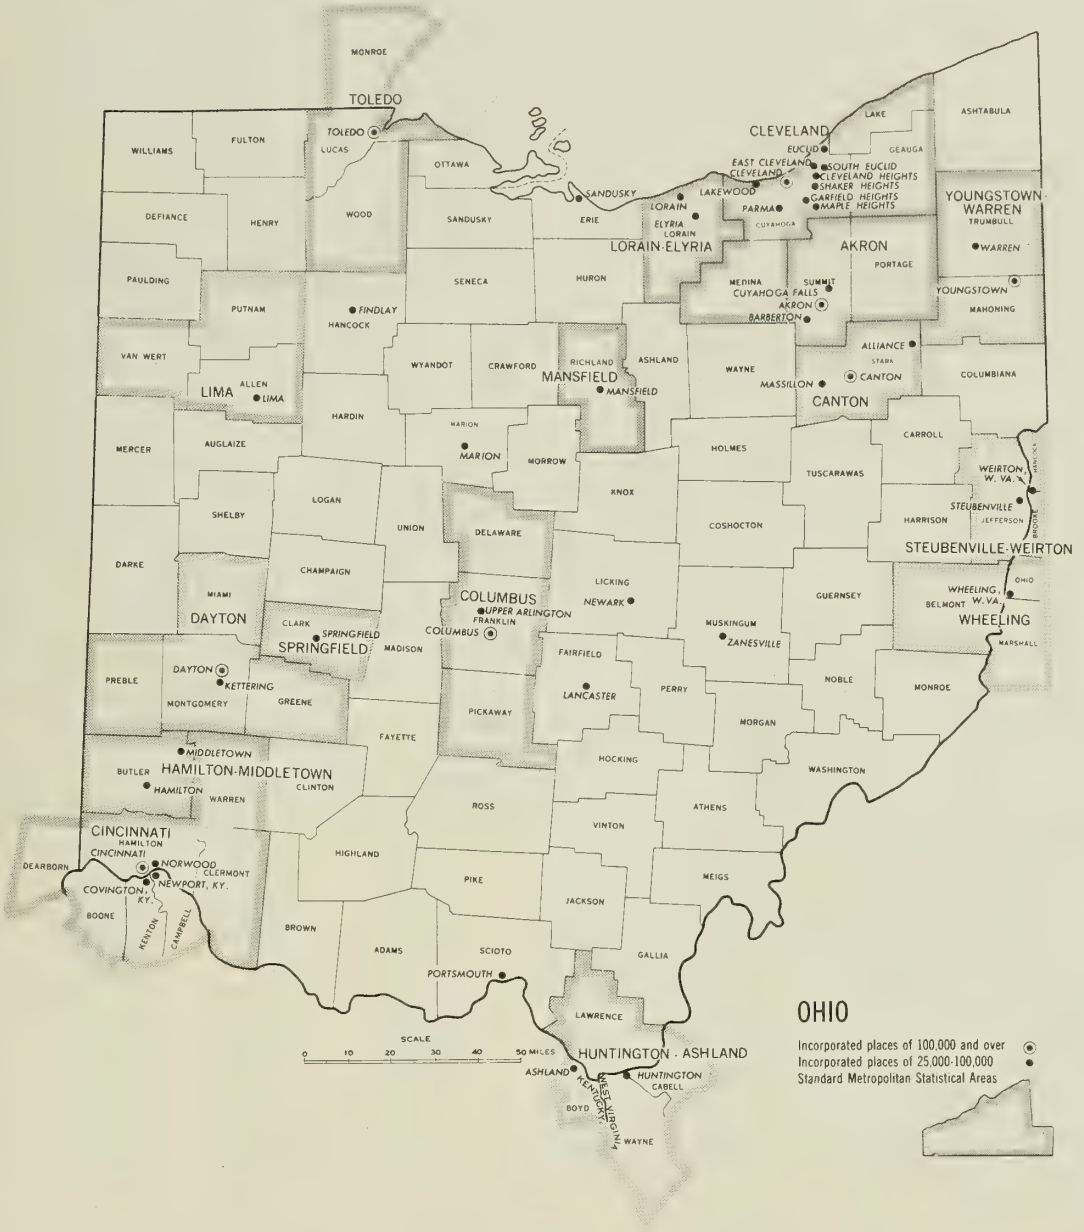
In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:



NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1902[6]	9.9	(NA)	2.7	(NA)	56.5	(NA)	(NA)
Excluding oil and gas extraction industries:							
1967	(D)	(NA)	(NA)	(NA)	371,5	(NA)	(NA)
1963	[13]68.4	22.7	[13]6.7	[14]27.9	306.8	[14]34.3	[14]3.7
1958	[17]88.7	([14])	[13]5.9	[14]16.1	280.7	[14]20.1	[14]2.9
1954[2]	[17]53.8	([14])	[13]5.2	[14]16.3	227.0	[14]15.9	[14]2.5
1939[3]	10.0	(NA)	.6	(NA)	53.8	(NA)	2.2
1929[8]	10.4	(NA)	.2	2.2	60.1	(NA)	3.0
1919[5]	14.5	-	.5	(NA)	89.0	(NA)	[16]6.6
1909[5]	4.1	-	.1	(NA)	34.1	(NA)	(NA)
1902[6]	3.3	(NA)	.1	(NA)	33.4	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--Ohio--Continued

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 228 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments.

[3]Except, in part, for value of shipments and value added, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing sandstone at such operations was $159 thousand; this value has been included in the value of shipments and value added in mining. The comparable value for limestone is not available.

[4]Represents number of mines and quarries, number of natural gas liquids plants, and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[5]Excludes data for sand, gravel, common clay, and shale operations, and stone quarries operated as parts of cement and lime plants. In 1939, the value of products of common clay and shale operations was $1,368 thousand. In 1929, the value of products was $11,339 thousand. For "Excluding oil and gas extraction operations," includes data for nonproducing oil and gas extraction establishments; there were 5 such operations in 1919 and 7 in 1909.

[6]Excludes data for sand, gravel, common clay, and shale operations; and stone quarries at 7 cement plants. Includes data for lime plants producing lime valued at $1,082 thousand, and includes data for lime plants and nonproducing establishments in the Crude Petroleum and Natural Gas Industry.

[7]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[8]Excludes data for common clay and shale operations and one nonproducing operation. The value of products of such operations in 1939 was $1,368 thousand.

[9]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]Excludes the cost of natural gas processed at natural gas liquids plants, but includes the estimated value prior to processing of natural gas liquids contained in such gas.

[12]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14]Excludes data for crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments.

[15]Represents natural gas purchased as a material and for resale.

[16]Excludes purchased electric energy. For "All operations" in 1939, and also for "Excluding oil and gas extraction" in 1929, the quantity of purchased electric energy amounted to only 4 percent of the total kw.-hrs. equivalent of energy used.

[17]Costs of minerals received for preparation are included with those for supplies, purchases for resale, and purchased fuels and electric energy. See also footnote 10.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)

1476	Rock salt	2	2	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	85	12	0.9	4.8	0.8	1.7	4.7	15.9	(D)	20.4	(D)	1.6	23.2
142	Crushed and broken stone (limestone)	16	8	0.3	1.9	0.3	0.6	1.9	7.2	2.1	9.3	(NA)	0.5	8.5
144	Sand and gravel	12	1	0.1	0.4	0.1	0.2	0.4	1.9	0.2	2.1	(NA)	0.1	2.1
145	Clay and related minerals	53	-	0.2	1.0	0.2	0.4	1.0	2.8	1.6	4.4	(NA)	0.5	7.8

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.
[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	1,195	1,541	Cost of supplies, total.....million dollars..	172.2	140.8
With 0 to 19 employees.....do....	998	1,361	Supplies used, minerals received for preparation, and purchased machinery.....do....	131.1	(NA)
With 20 to 99 employees.....do....	167	158	Cost of resales.....do....	2.3	
With 100 or more employees.....do....	30	22	Purchased fuels consumed.....do....	8.9	(NA)
All employees (average for year).....1,000..	18.0	17.6	Electric energy:		
			Quantity purchased.....million kw.-hrs..	573.0	(NA)
Payroll (all employees), total for year.....million dollars..	139.4	104.2	Cost.....million dollars..	8.0	(NA)
			Generated less sold.....million-kw.-hrs..	1.3	(NA)
Production, development, and exploration workers:			Contract work.....million dollars..	21.9	16.9
Average for the year.....1,000..	13.9	14.2	Value of shipments and receipts (including resales), total.....do....	401.3	318.8
March.....do....	13.4	(NA)	Value of resales.....do....	2.7	(NA)
May.....do....	13.9	(NA)			
August.....do....	14.3	(NA)			
November.....do....	14.1	(NA)	Value added in mining.....do....	281.4	223.9
Man-hours.....millions..	29.2	28.7	Capital expenditures (except land and mineral rights), total.....do....	52.3	45.8
Wages.....million dollars..	92.8	76.5	Mineral development and exploration.....do....	7.6	7.5
			New structures and additions.....do....	8.6	
Supplemental labor cost not included in payroll.....do..	18.2	(NA)	New machinery and equipment.....do....	32.3	38.4
			Used plant and equipment.....do....	3.9	
Legally required expenditures, including Social Security contributions.....do..	7.4	(NA)	Mineral development and exploration expenditures, total.....do....	13.1	(NA)
Payments for voluntary programs.....do..	10.8	(NA)	Capitalized.....do....	7.6	7.5
			Expensed.....do....	5.5	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

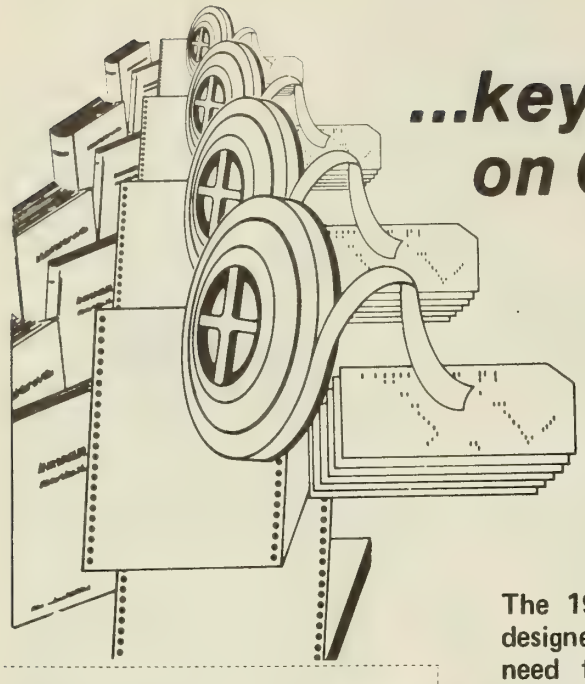
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

TABLE 1	General Statistics: 1967 and Earlier Years	2
2A	General Statistics for Mineral Establishments, by Industries: 1967 and 1963	4
2B	General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963	5
3	Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967	6
4	Detailed Statistics: 1967 and 1963	7
5	General Statistics by County and Industry Groups: 1967 and 1963	8
6	Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967	12
APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST
- New England
- Middle Atlantic

NORTH CENTRAL
- East North Central
- West North Central

SOUTH
- South Atlantic
- East South Central
- West South Central

WEST
- Mountain
- Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]1,782	304	30.1	219.6	17.4	35.1	102.2	985.1
1963	[1]2,519	300	32.9	199.9	21.3	41.6	105.8	805.9
1958	2,643	342	38.2	195.3	24.7	47.6	104.7	674.0
1954	2,610	393	40.9	176.9	30.3	61.1	115.1	584.4
Including operations in manufactures:								
1967	1,801	308	30.3	220.4	17.6	35.5	103.0	991.7
1963	2,547	301	33.1	200.6	21.5	41.9	106.5	810.2
1958	2,668	347	38.5	196.1	24.9	48.0	105.4	676.9
1954[2]	2,627	399	41.1	177.6	30.5	61.5	115.8	586.6
1939[3]	[4]1,687	(NA)	33.3	52.5	26.2	46.9	33.9	173.0
1929								
1919[5]	1,964	(NA)	39.8	59.5	34.0	(NA)	46.9	192.4
1909[5]	888	(NA)	13.0	9.1	11.7	(NA)	7.8	18.0
1902	[4]22	(NA)	.1	.1	[6].1	(NA)	.1	.2
Excluding oil and gas extraction industries:								
1967	118	30	1.7	9.0	1.4	3.2	7.5	27.4
1963	187	29	2.0	9.6	1.7	3.8	7.8	24.8
1958	182	33	2.5	11.2	2.1	4.4	9.4	23.1
1954[2]	238	44	3.6	13.3	3.4	7.3	12.2	26.3
1939[3]	[4]241	(NA)	5.8	5.9	5.2	10.3	5.1	11.8
1929[7]	220	(NA)	11.0	15.6	10.3	(NA)	13.6	25.2
1919[5]	286	(NA)	14.4	17.9	12.8	(NA)	16.1	25.5
1909[8]	166	(NA)	9.2	5.9	8.8	(NA)	5.5	6.5

Kind of operation and year	Selected expenses				Value of shipments and receipts [10]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation [9] (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[11]320.1	([11])	106.5	([11])	1,223.1	188.6	(NA)
1963	[12]150.7	[12]101.8	128.0	58.2	1,039.5	205.0	28.8
1958	[12]135.0	[12]50.5	126.8	60.4	860.6	186.2	31.6
1954	123.1	17.6	156.0	94.7	755.2	220.5	31.3
Including operations in manufactures:							
1967	[13]427.6	([13])	([13])	([13])	1,229.7	(NA)	(NA)
1963	[12] [14]151.3	[12]101.8	[14]128.0	[15]58.2	1,044.4	[15]205.0	[15]28.8
1958	[12] [14]135.6	[12] 50.5	[14]126.8	[15]60.4	864.1	[15]186.2	[15]31.6
1954[2]	[14]123.7	17.6	[14]158.0	[15]94.7	758.1	[15]220.5	[15]31.3
1939[3]	21.9	(NA)	13.8	(NA)	208.7	(NA)	23.1
1929							
1919[5]	60.6	[16]9.8	19.2	(NA)	281.9	(NA)	[17]7.7
1909[5]	5.3	[16].1	2.2	(NA)	25.6	(NA)	(NA)
1902	(Z)	(NA)	(Z)	(NA)	.2	(NA)	(NA)
Excluding oil and gas extraction industries:							
1967	[13]14.3	([13])	([13])	([13])	37.2	(NA)	(NA)
1963	[12] [14]10.2	([12])	[14].8	[15]2.0	35.3	[15]2.6	[15].6
1958	[12] [14]10.1	([12])	[14]1.0	[15]1.9	33.8	[15]2.1	[15].5
1954[2]	[14]8.5	6.9	[14].8	[15]2.1	42.7	[15]1.9	[15].5
1939[3]	4.0	(NA)	.2	(NA)	15.9	(NA)	5
1929[7]	7.6	(NA)	.3	1.0	33.1	(NA)	1.0
1919[5]	8.5	-	.5	(NA)	34.4	(NA)	[17]2.6
1909[8]	1.4	-	.1	(NA)	8.0	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for Table 1--Oklahoma--Continued

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 362 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments, if any.

[3]Excludes data for dimension stone dressing plants, if any, operated in conjunction with 2 dimension granite quarries.

[4]Represents number of mines and quarries, number of natural gas liquids plants, and for the crude petroleum and natural gas and mining services industries, number of operating companies.

[5]Excludes data for sand, gravel, common clay, and shale mining operations, and limestone quarries operated as parts of cement and lime plants. The value of products of such common sand, gravel, connom clay, and shale mining operations in 1939 was $613 thousand.

[6] Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[7]Excludes data for common clay and shale mining operations There were 9 such mines in 1939 with products valued at $68 thousand.

[8]Includes data for 11 nonproducing crude petroleum and natural gas operations. For 1902, only one establishment was reported in the Crude Petroleum and Natural Gas Industry. Hence, the 1902 figures shown for "All operations" are approximately comparable to the figures for later years shown for "Excluding oil and gas extraction industries." See also footnote 5.

[9]For years prior to 1958, excludes the cost of natural gas processed at natural gas liquids plants, but for 1954 includes the estimated value prior to processing of natural gas liquids contained in such gas.

[10]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of "Minerals received for preparation." For all other years, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[11]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]Figures for minerals received for preparation in the Metal Mining Industries are included with those for supplies, purchases for resale, and purchased fuels and electric energy.

[13]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[15]Excludes data for crushed and broken stone, and gravel, clay, and gypsum mining operations in manufacturing establishments, and for 1963 excludes data for dimension stone mining in manufacturing establishments.

[16]Represents natural gas purchased for resale.

[17]Excludes purchased electric energy. For "All operations" in 1939, the quantity of purchased electric energy amounted to only 1 percent of the total kw.-hrs. equivalent of energy used; but for "Excluding oil and gas extraction industries" in 1929 it amounted to 9 percent.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total	With 20 employees or more	Number	Payroll	Number	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)

1442	Construction sand and gravel	31	5	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1443	Glass sand	2	2	BB	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals except fuels	19	4	0.2	0.8	0.2	0.4	0.8	5.6	1.0	6.6	(NA)	0.2	4.3
145	Clay and related minerals	9	-	(Z)	0.1	(Z)	0.1	0.1	0.4	0.1	0.5	(NA)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967–Continued

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]	
				Total	Underground mines	Open-pit mines	Combination methods, well operations, and other methods	Total	Underground mines	Open-pit mines	Combination methods and other methods			
	Oklahoma--Continued													
14	Nonmetallic minerals, except fuels--Continued													
147	Chemical and fertilizer minerals:													
	Establishments.....number..	1	1	-	-	-	-	-	-	-	-	-	1	-
	Employees.....1,000..	(D)	(D)	-	-	-	-	-	-	-	-	-	(D)	-
	Value added in mining..mil.dol..	(D)	(D)	-	-	-	-	-	-	-	-	-	(D)	-
149	Miscellaneous nonmetallic minerals:													
	Establishments.....number..	6	6	1	-	1	-	5	-	5	-	-	-	-
	Employees.....1,000..	(Z)	(Z)	(D)	-	(D)	-	(D)	-	(D)	-	-	-	-
	Value added in mining..mil.dol..	.4	.4	(D)	-	(D)	-	(D)	-	(D)	-	-	-	-

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.
[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	1,782	2,519	Cost of supplies, total.....million dollars..	426.6	438.6
With 0 to 19 employees.....do....	1,478	2,219	Supplies used, minerals received for preparation, and purchased machinery.....do....	293.9	(NA)
With 20 to 99 employees.....do....	260	267	Cost of resales.....do....	1.3	(NA)
With 100 or more employees.....do....	44	33	Purchased fuels consumed.....do....	11.7	(NA)
All employees (average for year).....1,000..	30.1	32.9	Electric energy:		
			Quantity purchased.....million kw.-hrs..	964.1	(NA)
Payroll (all employees), total for year.....million dollars..	219.6	199.9	Cost.....million dollars..	13.2	(NA)
			Generated less sold.....million kw.-hrs..	241.7	(NA)
Production, development, and exploration workers:			Contract work.....million dollars..	106.5	128.0
Average for the year.....1,000..	17.4	21.3	Value of shipments and receipts (including resales), total.....do....	1,223.1	1,039.5
March.....do....	17.4	(NA)	Value of resales.....do....	2.9	(NA)
May.....do....	17.4	(NA)			
August.....do....	17.6	(NA)			
November.....do....	17.2	(NA)	Value added in mining.....do....	985.1	805.9
Man-hours.....millions..	35.1	41.6	Capital expenditures (except land and mineral rights), total.....do....	188.6	205.0
Wages.....million dollars..	102.2	105.8	Mineral development and exploration.....do....	91.9	98.8
			New structures and additions.....do....	16.4	106.2
Supplemental labor cost not included in payroll.....do..	16.0	(NA)	New machinery and equipment.....do....	69.9	
			Used plant and equipment.....do....	10.4	
Legally required expenditures, including Social Security contributions.....do..	8.0	(NA)	Mineral development and exploration expenditures, total.....do....	128.3	(NA)
Payments for voluntary programs.....do..	8.0	(NA)	Capitalized.....do....	91.9	98.8
			Expensed.....do....	36.4	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963

138	Oil and gas field services...	38	8	.4	2.6	.3	.8	2.1	6.1	2.4	8.1	.5	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

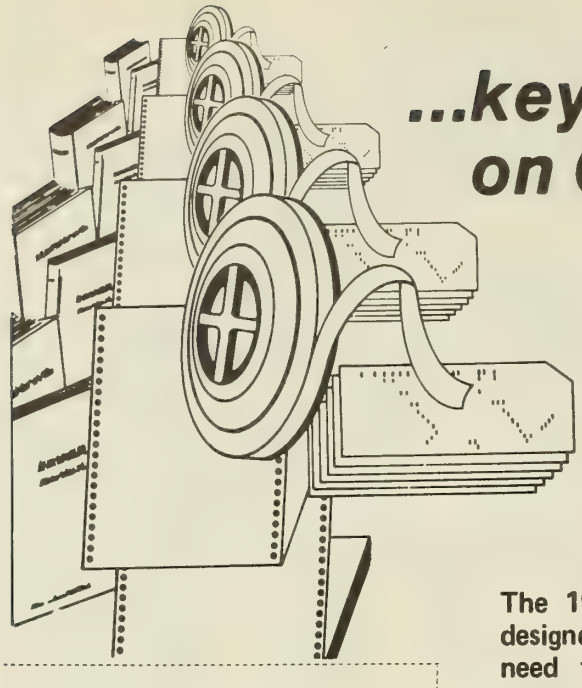
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

U.S. DEPARTMENT OF COMMERCE/Bureau of the Census

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 cen . for the first time, approximately 10,000 single-unit establis ients with one to four employees were excused from filin reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

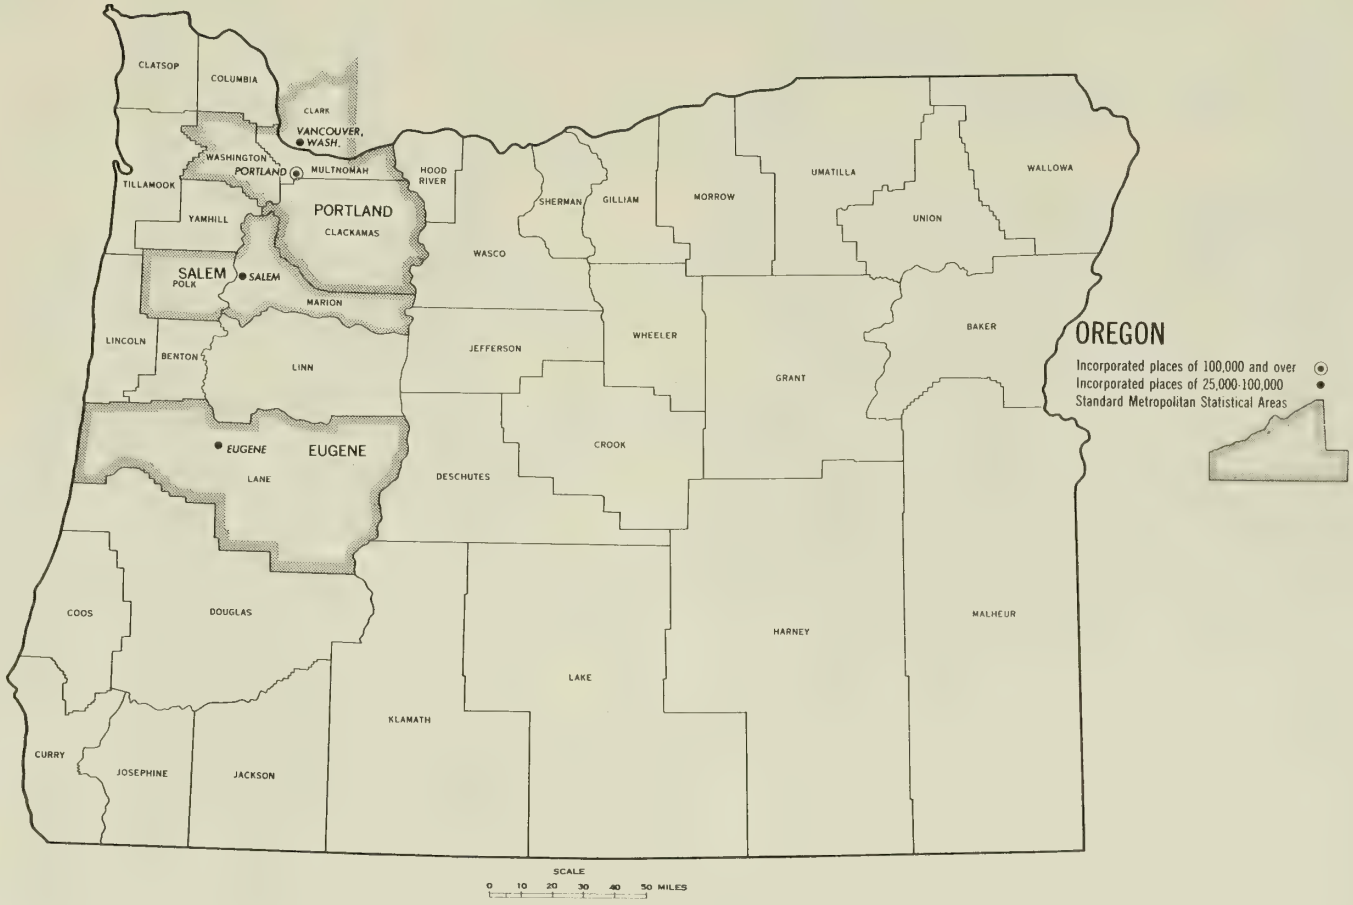
Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST
- New England
- Middle Atlantic

NORTH CENTRAL
- East North Central
- West North Central

SOUTH
- South Atlantic
- East South Central
- West South Central



WEST
- Mountain
- Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]160	18	1.4	9.5	1.2	2.4	8.2	27.3
1963	[1]206	22	1.9	11.2	1.6	3.0	8.8	17.7
1958	201	13	1.2	6.3	1.0	2.0	5.0	15.9
1954	278	13	1.4	6.3	1.3	2.6	5.5	12.6
Including operations in manufactures:								
1967	181	20	1.5	10.5	1.3	2.7	9.2	31.3
1963	231	22	2.1	11.8	1.7	3.3	9.4	21.3
1958	230	15	1.4	6.9	1.1	2.3	5.6	18.6
1954[2]	296	13	1.5	6.5	1.3	2.7	5.7	13.2
1939[3]	[4]128	(NA)	1.5	2.0	1.3	2.7	1.6	3.8
1929[5]	112	(NA)	1.2	1.8	1.1	(NA)	1.5	2.5

Kind of operation and year	Selected expenses				Value of shipments and receipts[6]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[7]9.9	([7])	3.6	([7])	35.1	5.6	(NA)
1963	7.3	.3	2.4	2.5	25.7	4.4	.4
1958	5.8	.2	3.0	1.6	19.9	6.6	.3
1954	4.6	.1	1.9	1.8	18.3	3.7	.3
Including operations in manufactures:							
1967	[8]13.8	([8])	([8])	([8])	39.4	(NA)	(NA)
1963	[9]7.9	.3	[9]8.4	[10]2.5	29.9	[10]4.4	[10].4
1958	[9]6.2	.2	[9]3.1	[10]1.6	23.1	[10]6.6	[10].3
1954[2]	[9]4.7	.1	[9]1.9	[10]2.8	18.9	[10]3.7	[10].3
1939[3]	1.3	(NA)	(Z)	(NA)	5.1	(NA)	.1
1929[5]	.9	(NA)	.1	.2	3.5	(NA)	.1

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 25 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments, if any.

[3]Excludes data for dimension stone dressing operations, if any, in conjunction with two stone quarries, not elsewhere classified.

[4]Represents number of mines and quarries.

[5]Excludes data for common clay and shale operations. There were 9 such mines in 1939 with products valued at $68 thousand.

[6]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of "Minerals received for preparation."

[7]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[8]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[9]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[10]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	160	18	1.4	9.5	1.2	2.4	8.2	27.3	13.5	35.1	5.6	1.9	17.7
10	Metal mining	18	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	(D)
106	Ferroalloy ores, except vanadium	1	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1069	Ferroalloy ores, n.e.c.	1	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
14	Nonmetallic minerals, except fuels	132	17	1.2	8.1	1.0	2.1	7.1	19.0	9.9	26.4	2.6	1.8	(D)
142	Crushed and broken stone	61	12	.6	4.2	.6	1.1	3.6	10.3	4.9	14.1	1.1	.6	5.1
1422	Crushed and broken limestone	13	5	.2	1.5	.2	.4	1.3	3.3	1.6	4.7	.3	(NA)	(NA)
1429	Crushed and broken stone, n.e.c.	48	7	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.4	4.0
144	Sand and gravel	57	5	.5	3.4	.4	.8	3.0	7.6	4.3	10.7	1.3	1.1	10.2
1442	Construction sand and gravel	56	5	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	21	2	0.1	1.0	0.1	0.3	1.0	4.0	0.3	4.3	(NA)	0.1	3.7
144	Sand and gravel	11	2	0.1	0.9	0.1	0.2	0.9	3.4	0.2	3.6	(NA)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

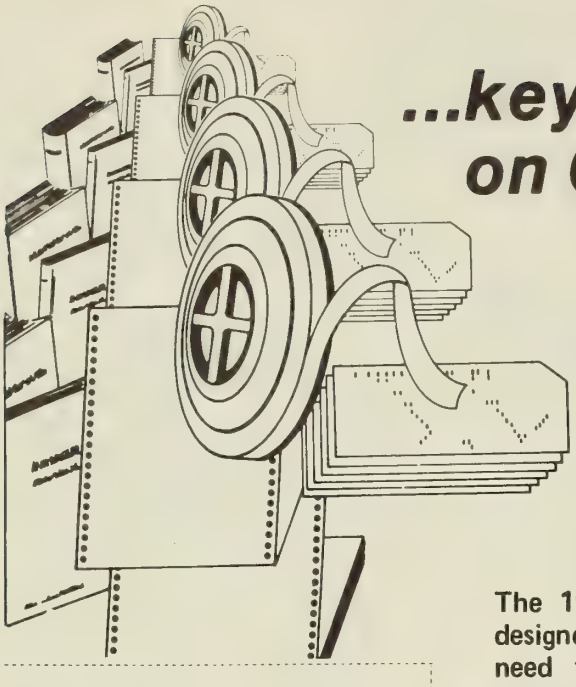
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

ORDER FORM

Please indicate number of copies

☐ **PARTS 1 and 2** of the 1970 Census Users' Guide @ $4.00 for both

☐ **PART 1** only of the 1970 Census Users' Guide @ $1.25 per copy
C3.6/2:C33/4/970/PT.1

☐ **PART 2** only of the 1970 Census Users' Guide @ $2.75 per copy
C3.6/2:C33/4/970/PT.2

TABLE 1	General Statistics: 1967 and Earlier Years	2
2A	General Statistics for Mineral Establishments, by Industries: 1967 and 1963	4
2B	General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963	5
3	Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967	6
4	Detailed Statistics: 1967 and 1963	8
5	General Statistics by County and Industry Groups: 1967 and 1963	9
6	Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967	14
APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

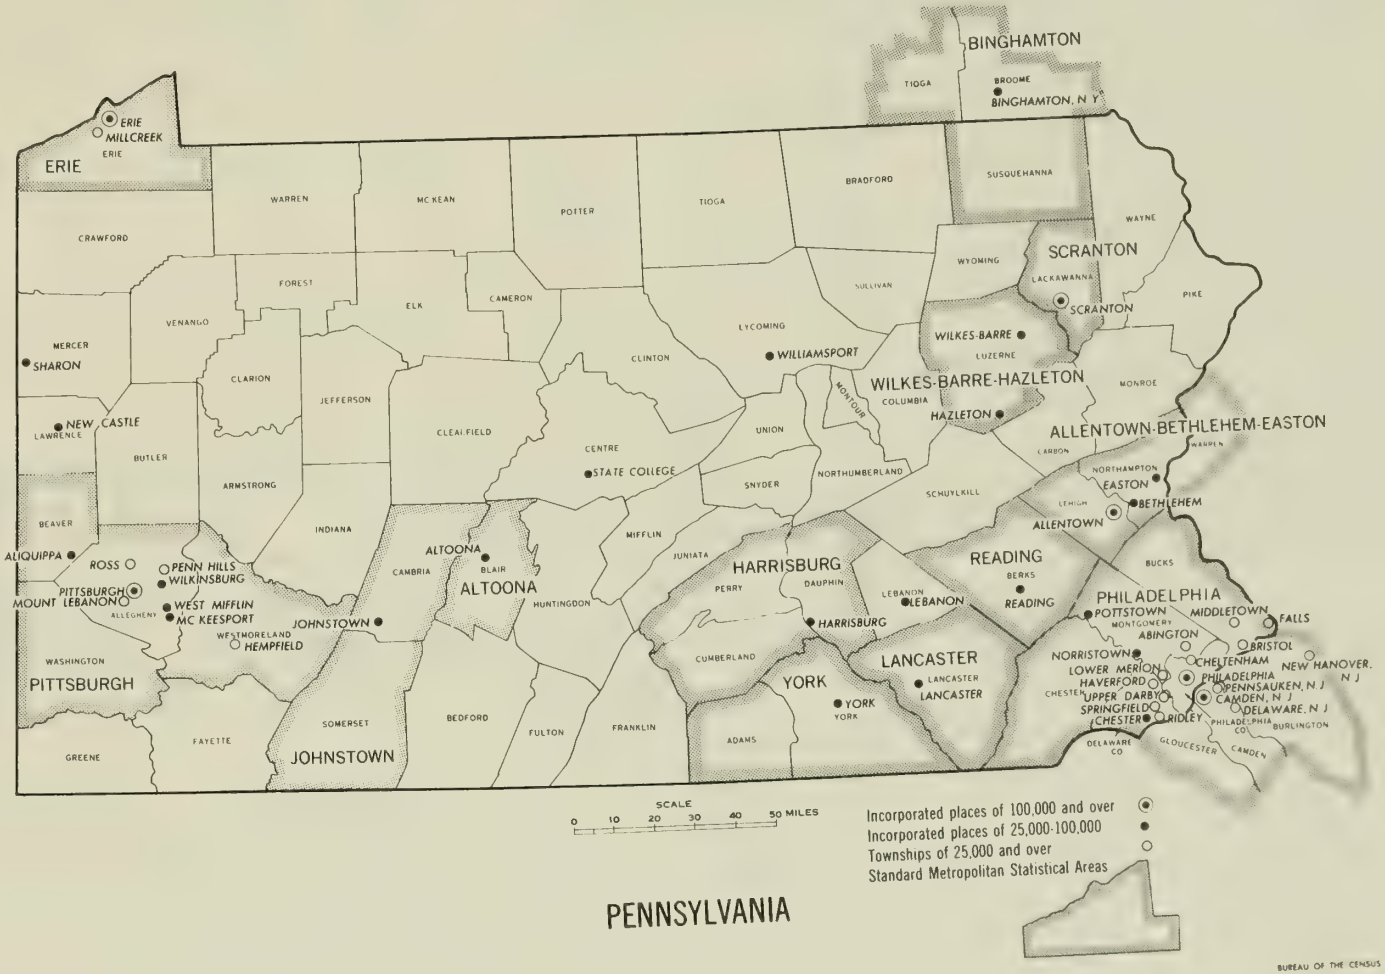
In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:



NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1963	[14]168.1	[14]3.4	[14]57.7	[15]59.5	928.4	[15]85.8	[15]8.9
1958	[14]172.3	[14]9.2	[14]77.0	[15]57.0	998.4	[15]76.1	[15]11.5
1954[2]	[14]158.4	[14]6.6	[14]96.1	[15]53.0	1,082.0	[15]59.2	15.4
1939[3]	73.5	(NA)	16.0	(NA)	473.9	(NA)	27.7
1919[5]	146.7	[16]5.5	8.0	(NA)	819.5	(NA)	101.9
1909[5]	51.7	3.1	6.0	(NA)	349.1	(NA)	(NA)
1902[6]	29.1	(NA)	5.6	(NA)	226.6	(NA)	(NA)
Excluding oil and gas extraction industries:							
1967	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
1963	[14]158.6	142.6	[14]48.1	[15]55.8	868.5	[15]71.7	[15]7.3
1958	[14]159.3	157.7	[14]65.8	[15]53.1	930.4	[15]62.7	[15]9.9
1954[2]	[14]144.6	176.5	[14]74.2	[15]46.2	992.7	[15]41.2	[15]13.5
1939[3]	69.4	(NA)	12.1	(NA)	425.0	(NA)	25.6
1929[7]	106.2	(NA)	7.5	15.8	695.0	(NA)	54.4
1919[5]	136.1	5.0	3.5	(NA)	753.2	(NA)	99.0
1909[8]	46.3	(Z)	2.7	(NA)	309.9	(NA)	(NA)
1902[9]	23.1	(NA)	.9	(NA)	197.0	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 855 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--Pennsylvania--Continued.

[2] Excludes figures for sand and gravel mining operations in manufacturing establishments.

[3] Except, in part, for value of shipments and value added in mining, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing granite, slate, and sandstone at such operations was $924 thousand; this value has been included in the value of shipments and value added in mining. The comparable value for basalt, if any, is not available. For statistics "Excluding oil and gas extraction industries," includes data for one nonproducing crude petroleum and natural gas establishment.

[4] Represents number of mines and quarries, number of natural gas liquids plants, and, for crude petroleum and natural gas and mining services industries, number of operating companies.

[5] Excludes figures for sand, gravel, common clay, and shale mining operations and for crushed and broken stone quarries operated as parts of cement or lime establishments. For 1939, the census included 64 sand and gravel operations with products valued at $6,619 thousand; 59 common clay and shale pits with products valued at $560 thousand; and 48 such stone quarries with products valued at $4,525 thousand. For energy used for 1919, excludes purchased electric energy. For 1939, for "all operations," the quantity of purchased electronic energy amounted to only 5 percent of the total kw.-hrs. equivalent of energy used; and for 1929, for "Excluding oil and gas extration industries," to only 2 percent.

[6] Excludes figures for sand, gravel, common clay, and shale mining operations and for crushed and broken stone quarries operated as parts of cement establishments. Includes data for lime plants producing lime valued at $1,430 thousand. Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[7] Excludes figures for common clay and shale operations. There were 59 such mines reported for 1939 with products valued at $560 thousand.

[8] Includes figures for nonproducing oil and gas extraction operations. See also footnote 5.

[9] Includes figures for nonproducing oil and gas extraction operations. See also footnote 6.

[10] For years prior to 1958, excludes the cost of natural gas processed at natural gas liquids plants.

[11] For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants, but for 1954 includes the estimated value prior to processing of natural gas liquids contained in such gas.

[12] Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13] Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14] For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[15] Excludes figures for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments. For energy used and horsepower in 1963, also excludes figures for dimension stone operations in manufactures.

[16] Includes figures for gas purchased for resale without processing.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	2041	392	42.3	296.7	35.7	71.2	235.1	603.0	431.9	949.4	85.4	48.9	555.3

149	Miscellaneous nonmetallic minerals	15	-	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

[2] Includes figures for separately reported central offices and related facilities in Massachusetts.
[3] Includes figures for separately reported central offices and related facilities in New York.

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees [1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	81	21	1.4	7.5	1.4	2.8	7.2	20.9	5.4	26.2	(NA)	1.8	30.0
142	Crushed and broken stone	30	12	0.8	4.0	0.8	1.5	4.0	14.3	3.8	18.1	(NA)	0.7	16.1
145	Clay and related minerals	32	-	0.1	0.6	0.1	0.3	0.6	2.1	0.5	2.6	(NA)	0.4	7.8

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

142	Crushed and broken stone.....	7	4	.2	1.9	.2	.5	1.3	2.7	1.2	3.7	.2	.3	3.6

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

–	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]22	7	.3	2.1	.3	.6	1.7	3.3
1963	[1]21	4	.2	1.1	.2	.4	.9	2.0
1958	18	3	.1	.6	.1	.2	.5	1.4
1954	20	3	.2	.6	.1	.3	.5	1.1
Including operations in manufactures:								
1967	25	7	.3	2.1	.3	.6	1.7	3.7
1963	23	4	(D)	(D)	(D)	(D)	(D)	(D)
1958	22	4	.2	.9	.2	.3	.7	1.9
1954[2]	21	3	.2	.6	.1	.3	.5	1.1
1939	[3]21	(NA)	.3	.3	.2	.4	.3	.6
1929	14	(NA)	.3	.5	.3	(NA)	.4	.6
1919[4]	14	(NA)	.4	.5	.4	(NA)	.4	.8
1909[4]	21	(NA)	.7	.5	.7	(NA)	.4	.7
1902[5]	[3]22	(NA)	.7	.5	[6].7	(NA)	.4	.7

Kind of operation and year	Selected expenses				Value of shipments and receipts[7]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[8]1.5	([8])	.6	([8])	4.8	.6	(NA)
1963	[9].5	([9])	.3	.1	2.7	.3	(Z)
1958	.3	-	.1	.2	1.6	.2	(Z)
1954	.4	-	(Z)	.2	1.5	.2	(Z)
Including operations in manufactures:							
1967	[10]2.1	([10])	([10])	([10])	5.2	(NA)	(NA)
1963	(D)	(D)	(D)	(D)	(D)	(D)	(NA)
1958	[11].5	([11])	[11].1	[12].2	2.4	[12].2	[12](Z)
1954[2]	.4	-	(Z)	.2	1.4	.2	(Z)
1939	.2	(NA)	(Z)	(NA)	.8	(NA)	(Z)
1929	.2	(NA)	(Z)	(Z)	.8	(NA)	(Z)
1919[4]	.2	-	(Z)	(NA)	1.0	(NA)	[13].1
1909[4]	.2	-	-	(NA)	.9	(NA)	(NA)
1902[5]	.1	(NA)	-	(NA)	.8	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time, data for single unit establishments without paid employees were excluded from the census. In 1963, there were 0 single unit establishments without paid employees in this State.

[2]Except for number of establishments, excludes data for one dimension granite operation classified in the manufacturing industries. Excludes data for any sand and gravel mining operations in manufacturing establishments.

[3]Represents number of mines and quarries.

[4]Excludes data for sand and gravel mining operations and any stone quarries operated as parts of lime plants. There were 2 such sand and gravel establishments in 1929.

[5]Excludes data for sand and gravel mining operations. May include lime plants producing lime valued at not more than $73 thousand.

[6]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[7]For sand and gravel mining operations in manufacturing establishments includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication.

[8]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[9]Cost of minerals received for preparation is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[10]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]For dimension stone and sand and gravel mining operations in manufacturing establishments, the cost of minerals received for preparation and the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[12]Excludes data for dimension stone and sand and gravel mining operations in manufacturing establishments.

[13]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 5 percent of total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1].....	22	7	.3	2.1	.3	.6	1.7	3.3	2.1	4.8	.6	.2	2.0
14	Nonmetallic minerals, exc. fuels	21	7	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
142	Crushed and broken stone.....	2	2	BB	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
1422	Crushed and broken limestone	2	2	BB	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
144	Sand and gravel.....	17	5	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	1.3

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels (sand and gravel).....	3	-	(Z)	(Z)	(Z)	(Z)	(Z)	0.4	(Z)	0.4	(NA)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

14	Nonmetallic minerals, except fuel.....	15	5	.2	1.2	.2	.4	1.0	2.2	1.3	3.3	.3	.1	1.3
144	Sand and gravel.....	11	3	.1	.8	.1	.3	.7	1.8	1.1	2.7	.2	(NA)	(NA)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such well for their own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represent the number of reports received, while county establishment counts represent the number of reports that indicated operations in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)
Rhode Island, total.....	22	-	-	-	1	21
1 to 4 employees.....	7	-	-	-	1	6
5 to 9 employees.....	4	-	-	-	-	4
10 to 19 employees.....	4	-	-	-	-	4
20 to 49 employees.....	7	-	-	-	-	7
Kent county, total.....	5	-	-	-	-	5
1 to 19 employees.....	3	-	-	-	-	3
20 to 99 employees.....	2	-	-	-	-	2

Standard notes: - Represents zero.
[1] See table 5, footnote 1.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

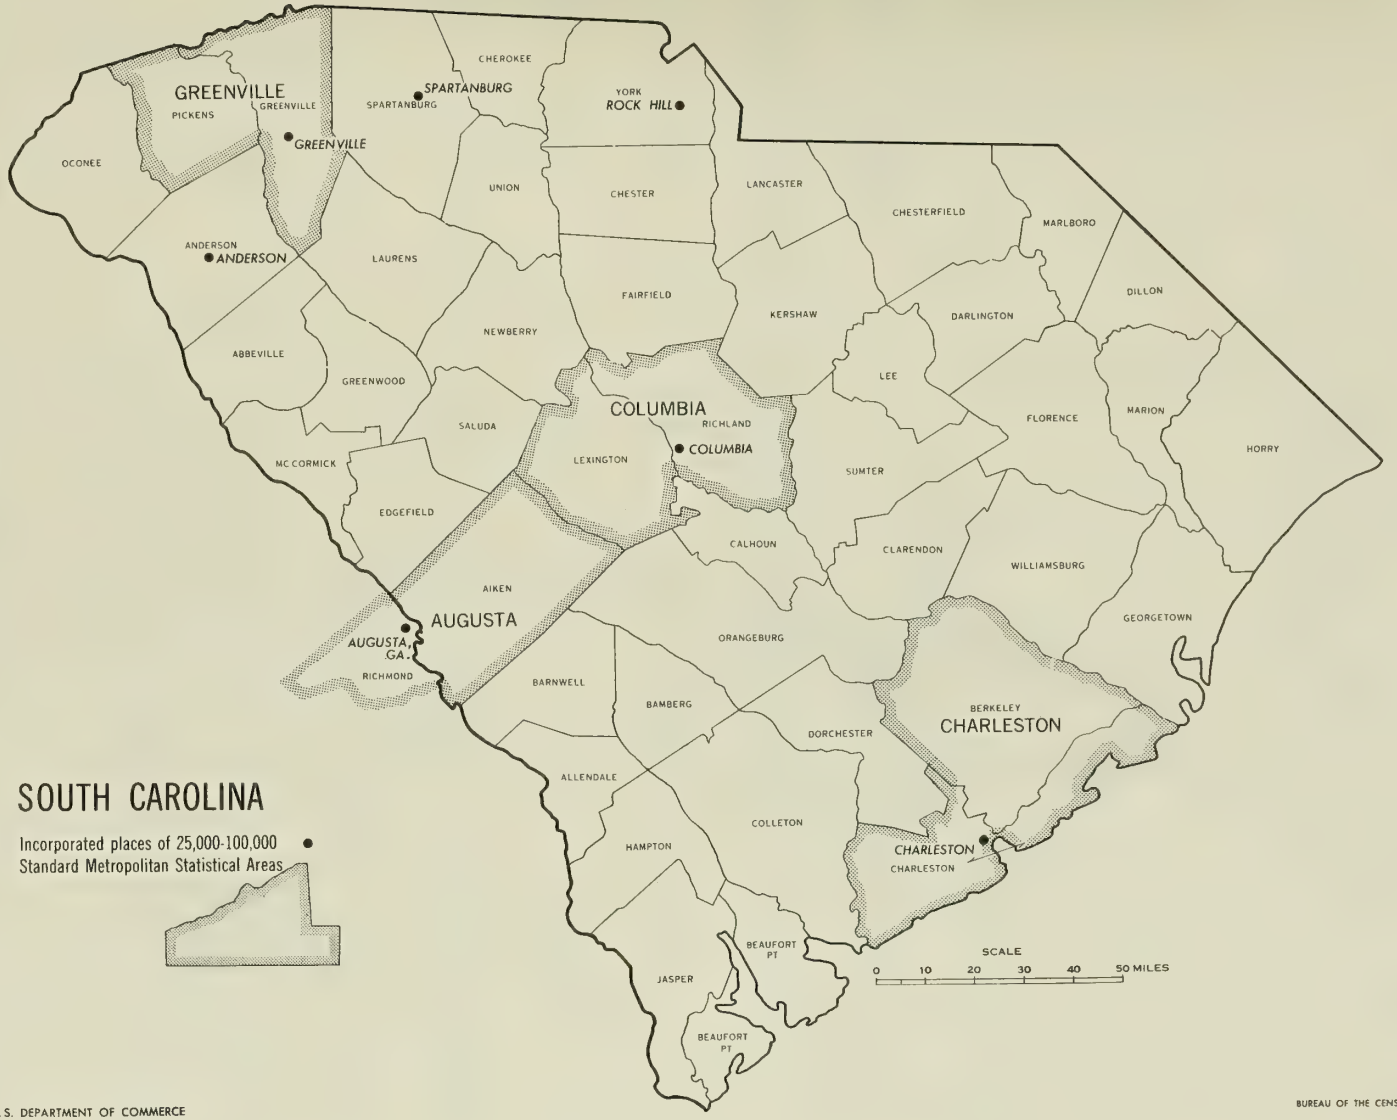
Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST
- New England
- Middle Atlantic

NORTH CENTRAL
- East North Central
- West North Central

SOUTH
- South Atlantic
- East South Central
- West South Central



WEST
- Mountain
- Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1909[6]	.2	-	(Z)	(NA)	1.3	(NA)	(NA)
1902[7]	.3	(NA)	-	(NA)	1.8	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 4 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments.

[3]Excludes data for dimension stone dressing, if any, at one dimension granite quarry and, except for number of establishments, excludes data for 2 mining services operations.

[4]Represents number of mines and quarries and, for mining services industries, number of operating companies.

[5]Excludes data for common clay and shale mining operations. There were 12 such mines in 1939, with products valued at $75 thousand.

[6]Excludes data for sand and gravel mining operations and for stone quarries operated as parts of cement and lime plants, if any. In 1929, there were 6 such sand and gravel establishments, with products valued at less than $395 thousand and no such stone quarries. See also footnote 5.

[7]Excludes data for common clay and shale and sand and gravel mining operations and for one nonproducing operation. May include data for one lime plant.

[8]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, the figures represent net production and exclude this duplication.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]For crushed and broken stone, sand and gravel, clay, and, for 1963, dimension stone mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy. Also, for 1963 and 1958, the cost of minerals received for preparation is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[12]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

[14]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 5 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	59	26	1.6	8.6	1.4	3.1	6.6	21.5	15.3	32.6	4.1	1.7	19.0
14	Nonmetallic minerals, except fuels	56	25	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
142	Crushed and broken stone	14	10	.6	3.0	.5	1.1	2.5	7.0	6.5	11.0	2.5	.7	9.3

1423	Crushed and broken granite	11	9	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.6	7.7
144	Sand and gravel	28	7	.5	2.4	.4	.9	1.8	5.8	3.2	8.2	.9	.3	3.4
1442	Construction sand and gravel	25	5	.4	2.0	.3	.7	1.5	4.8	2.3	6.5	.6	(NA)	(NA)
1443	Glass sand	2	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
145	Clay and related minerals	7	6	.4	2.3	.4	.8	1.8	5.4	(D)	8.4	(D)	.5	4.8
1455	Kaolin and ball clay	5	5	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1459	Clay and related minerals, n.e.c.	2	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
149	Miscellaneous nonmetallic minerals	4	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	1.3
1499	Nonmetallic minerals, n.e.c.	2	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	15	1	0.1	0.5	0.1	0.2	0.5	5.5	0.3	5.8	(NA)	0.1	1.5
1459	Clay and related minerals, n.e.c.	11	-	(Z)	0.1	(Z)	0.1	0.1	3.1	0.1	3.2	(NA)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mined products produced whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments

	Spartanburg county, total.....	5	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
14	Nonmetallic minerals, except fuels.....	5	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract service for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represent the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)
South Carolina, total	[1]59	1	-	-	2	56

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

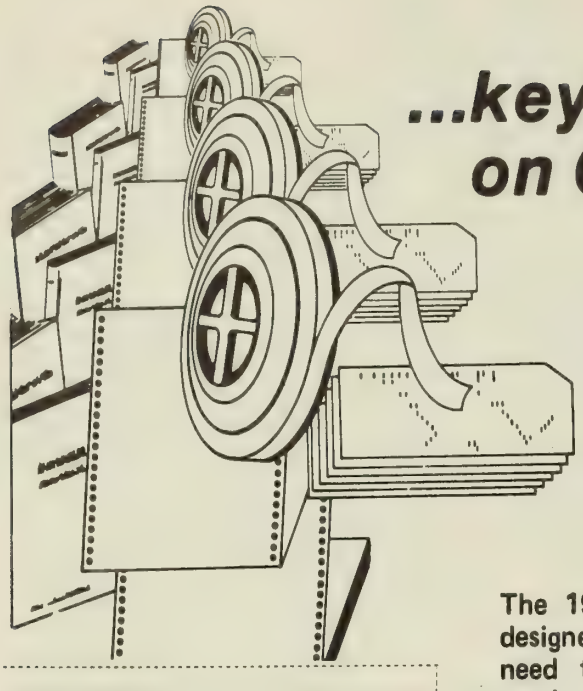
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]81	7	2.2	13.9	1.9	4.4	11.3	23.6
1963	[1]131	14	2.6	13.7	2.2	4.9	11.7	25.6
1958	133	13	2.6	12.6	2.2	4.6	10.7	25.1
1954	187	23	2.9	11.7	2.5	5.7	9.9	[2]22.4
Including operations in manufactures:								
1967	85	9	(D)	(D)	(D)	(D)	(D)	(D)
1963	141	17	2.7	14.5	2.4	5.2	12.4	27.3
1958	142	16	2.7	13.3	2.4	5.0	11.3	26.3
1954[3]	191	25	3.0	12.3	2.6	5.9	10.3	23.3
1939[4]	[5]59	(NA)	2.9	5.5	2.6	6.0	4.7	[2]20.7
1929[6]	42	(NA)	1.7	3.1	1.6	(NA)	2.6	6.0
1919[7]	28	(NA)	1.9	2.8	1.9	(NA)	2.6	3.9
1909[7]	55	(NA)	3.7	3.5	3.6	(NA)	3.3	4.9
1902[8]	[5]185	(NA)	3.9	4.3	[9]3.7	(NA)	4.0	4.6

Kind of operation and year	Selected expenses				Value of shipments and receipts[10]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[12]10.3	([11])	.6	([11])	32.8	1.6	(NA)
1963	[12]12.3	([12])	2.0	1.0	37.9	3.0	.5
1958	[12]10.0	([12])	.8	1.5	34.9	2.5	.5
1954	7.5	.6	2.3	2.1	31.3	3.5	.8
Including operations in manufactures:							
1967	(D)	(D)	(D)	(D)	(D)	(D)	(NA)
1963	[12] [13]12.8	([12])	[13]2.0	[14]1.0	40.2	[14]3.0	[14].5
1958	[12] [13]10.5	([12])	[13].8	[14]1.6	36.5	[14]2.6	[14].5
1954[3]	[13] 7.8	.6	[13]2.3	[14]2.1	32.4	[14]3.6	[14].8
1939[4]	2.2	(NA)	(Z)	(NA)	22.9	(NA)	.6
1929[6]	1.7	(NA)	(Z)	(Z)	7.6	(NA)	.4
1919[7]	1.4	-	(Z)	(NA)	5.3	(NA)	[15].4
1909[7]	1.5	.1	(Z)	(NA)	6.4	(NA)	(NA)
1902[8]	2.2	(NA)	(Z)	(NA)	6.8	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 37 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for the Uranium-Radium-Vanadium Ores Industry.

[3]Excludes data for sand and gravel mining operations in manufacturing establishments.

[4]Except for value of shipments and value added in mining, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing granite and sandstone at such operations was $197 thousand; this value has been included in the value of shipments and value added in mining.

[5]Represents number of mines and quarries and, for crude petroleum and natural gas and mining services industries, number of operation companies.

[6]Excludes data for operations in the crude petroleum and natural gas extraction industries and for common clay and shale operations, if any. Includes data for one establishment in North Dakota.

[7]Excludes data for sand, gravel, common clay, and shale mining operations, if any.

[8]Includes data for lime plants producing lime valued at $21 thousand.

[9]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[10]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years represents net production and excludes this duplication. For 1954, excludes data for the Uranium-Radium-Vanadium Ores Industry.

[11]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]Figures for the cost of minerals received for preparation are included with those for the cost of supplies, purchases for resale, and purchased fuels and electricity.

[13]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, and for dimension stone mining operations in manufactures for 1958, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14]Excludes data for crushed and broken stone, sand and gravel, clay, and for 1963 dimension stone mining operations in manufacturing establishments.

[15]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to less than one percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments[1]		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total	With 20 employees or more	Number	Payroll	Number	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations.....	81	7	2.2	13.9	1.9	4.4	11.3	23.6	10.9	32.8	1.6	2.6	25.6
10	Metal mining.....	8	1	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	1.9	(2)
104	Gold and silver ores.....	1	1	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1042	Lode gold.....	1	1	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	1.8	16.4
14	Nonmetallic minerals, except fuels.....	52	6	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
142	Crushed and broken stone.....	8	3	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1429	Crushed and broken stone, n.e.c.....	4	3	.1	.6	.1	.2	.5	1.4	.9	2.0	.3	(NA)	(NA)
144	Sand and gravel.....	36	1	.2	1.0	.1	.3	.8	2.0	1.7	3.0	.7	.3	2.5
1442	Construction sand and gravel	35	-	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
145	Clay and related minerals.....	4	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	3.0
1452	Bentonite.....	1	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

[2] Figures for metal mining are included with those for lignite mining and nonmetallic minerals mining.

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total	With 20 employees or more	Number	Payroll	Number	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	South Dakota, total.....	4	2	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	1.7

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

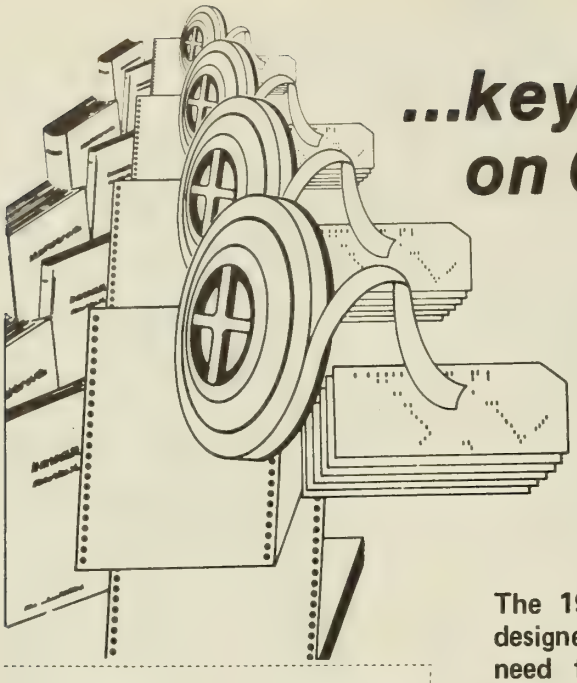
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

6	Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967	8
APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

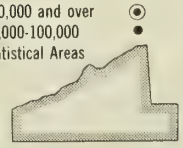
CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:



—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]352	99	6.9	39.1	6.0	12.4	31.6	116.2
1963	[1]503	87	6.9	32.4	6.0	12.3	27.3	90.1
1958	533	94	8.7	32.6	7.5	13.8	26.8	62.0
1954	665	105	9.6	30.2	8.8	16.3	26.4	61.1
Including operations in manufactures:								
1967	364	102	7.2	40.5	6.2	12.9	32.9	121.4
1963	528	94	7.5	34.7	6.6	13.4	29.3	94.7
1958	562	106	9.7	35.6	8.4	15.6	29.4	69.5
1954[2]	692	112	10.2	32.0	9.4	17.4	28.0	65.2
1939[3]	[4]266	(NA)	12.5	11.9	11.7	19.6	10.5	18.4
1929[5]	163	(NA)	12.9	12.9	12.0	(NA)	11.0	19.6
1919[6]	203	(NA)	15.4	14.6	14.5	(NA)	13.0	19.0
1909[6]	246	(NA)	17.3	8.4	16.4	(NA)	7.4	10.3
1902[7]	[4]256	(NA)	11.7	5.5	[8]10.9	(NA)	4.9	8.5

Kind of operation and year	Selected expenses				Value of shipments and receipts[9]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[10]45.8	([10])	8.3	([10])	151.3	19.0	(NA)
1963	29.5	4.6	7.1	8.5	126.7	13.2	2.6
1958	[11]37.6	([11])	3.2	5.9	100.2	8.5	2.0
1954	18.5	1.0	3.7	5.5	82.8	7.0	1.1
Including operations in manufactures:							
1967	[12](D)	([12])	([12])	([12])	157.2	(NA)	(NA)
1963	[13]31.0	5.1	[13]7.1	[14]8.6	133.2	[14]13.3	[14]2.6
1958	[11] [13]39.2	([11])	[13]3.2	[14]6.0	109.2	[14]8.7	[14]2.0
1954[2]	[13]19.6	1.2	[13]3.7	[14]5.5	88.3	[14]7.1	[14]1.1
1939[3]	4.2	(NA)	.1	(NA)	22.7	(NA)	1.7
1929[5]	4.5	(NA)	.1	1.1	24.2	(NA)	[15]1.7
1919[6]	4.2	-	.2	(NA)	23.3	(NA)	2.3
1909[6]	2.3	(Z)	.1	(NA)	12.7	(NA)	(NA)
1902[7]	.9	(NA)	.2	(NA)	9.5	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 134 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments, if any.

[3]Except, in part, for value of shipments and value added in mining, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing marble and sandstone at such operations was $551 thousand; this value has been included in the value of shipments and value added in mining. Except in number of establishments, excludes data for one contract service operation and one nonproducing operation.

[4]Represents number of mines and quarries and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[5]Excludes data for common clay and shale operations, and for oil and gas extraction operations, if any. For 1939, there were 16 common clay and shale mines, with products valued at $137 thousand, and 9 oil and gas extraction operations, with products valued at $45 thousand.

[6]Excludes data for sand, gravel, common clay, and shale operations, and quarries operated as parts of cement and lime establishments. In 1929, there were 20 sand and gravel establishments, with products valued at $2,137 thousand; 5 stone quarries operated as parts of cement plants, with products valued at $467 thousand; and one stone quarry operated as part of a lime plant. For 1919, excludes data for one nonproducing establishment.

[7]Excludes data for sand, gravel, common clay, and shale operations. Includes data for lime plants producing lime valued at $236 thousand.

[8]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]Figures for minerals received for preparation are included with those for supplies, purchases for resale, and purchased fuels and electricity.

[12]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

[15]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only 5 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	352	99	6.9	39.1	6.0	12.4	31.6	116.2	54.1	151.3	19.0	6.9	90.1
10	Metal mining	13	11	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.9	10.0

147	Chemical and fertilizer minerals	19	6	.6	4.0	.5	1.1	3.4	22.0	8.8	29.3	1.5	(D)	(D)
1475	Phosphate rock	16	5	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	12	3	0.3	1.4	0.2	0.5	1.3	5.2	(D)	5.9	(D)	0.7	4.6

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

121	Bituminous coal and lignite mining	11	3	.1	.5	.1	.2	.4	1.2	.6	1.6	.3	.1	1.4
	Shelby county, total	25	4	.2	1.4	.2	.4	1.0	2.9	1.3	3.0	1.1	.2	1.6
14	Nonmetallic minerals, except fuels	15	4	.2	1.4	.2	.4	.9	2.5	.9	3.0	.3	.2	1.5
144	Sand and gravel	15	4	.2	1.4	.2	.4	.9	2.5	.9	3.0	.3	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

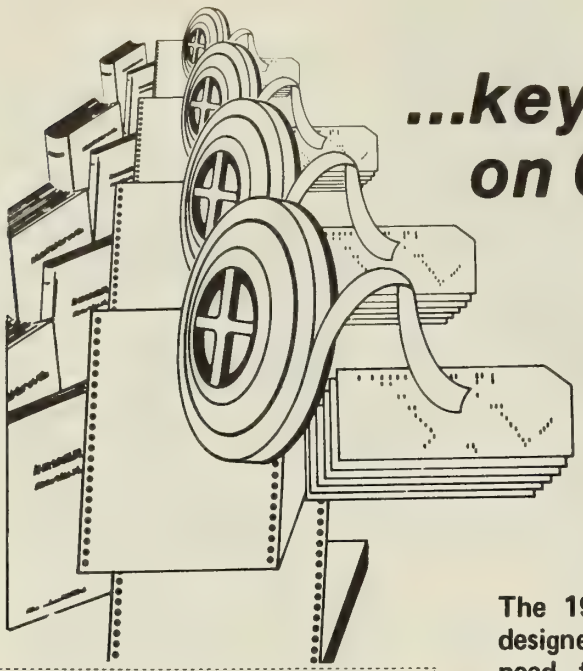
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--Texas--Continued

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 1,189 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Figures for number of establishments in 1963 are not entirely comparable with those for earlier years. For 1963, operators of oil and gas field properties were asked to make separate reports by districts for 11 districts in Texas,whereas only one report was required for each State on previous years.

[3]Excludes data for sand and gravel mining operations in manufacturing establishments.

[4]Except for value of shipments and value added in mining, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing limestone and granite at such operations was $21 thousand; this value was included in the value added in mining.

[5]Represents number of mines and quarries, number of natural gas liquids plants, and for the crude petroleum and natural gas and mining services industries, number of operating companies.

[6]Excludes data for sand, gravel, common clay, and shale mining operations and limestone quarries operated as part of cement and lime plants. In 1939, there were 102 such mines and quarries with products valued at $3,963 thousand. For 1919, excludes data for one nonproducing establishment.

[7]Excludes data for sand, gravel, common clay, and shale mining operation. Includes data for 2 cement plants and for lime plants producing lime valued at $82 thousand.

[8]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9]Except for number of establishments, excludes data for 4 nonproducing mines. See also footnote 8.

[10]Excludes data for common clay and shale mining operations. In 1939, there were 32 such mines with products valued at $256 thousand.

[11]Except for number of establishments, excludes data for 3 nonproducing establishments. See also footnote 10.

[12]Excludes data for nonproducing operation. See also footnote 13.

[13]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in 1958 and 1954,the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14]For 1963, 1958, and 1954, excludes data for crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments.

[15]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[16]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale,and purchased fuels and electric energy.

[17]For 1958, figures for dimension stone operations in manufactures and, for 1954, all figures for minerals received for preparation are included with those for supplies, purchases for resale, and purchased fuels and electric energy. Excludes the cost of natural gas received for processing at natural gas liquids plants, but includes the estimated value prior to processing of natural gas liquids contained in such gas.

[18]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[19]Represents natural gas purchased as a material or for resale.

[20]Excludes purchased electricity. For "all operations" in 1939, the quantity of purchased electricity amounted to less than 1 percent of the total kw.-hrs. equivalent of energy used; also, for "excluding oil and gas extraction industries" in 1929, to less than 1 percent.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total	With 20 employees or more	Number	Payroll	Number	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total	With 20 employees or more	Number[1]	Payroll[1]	Number[1]	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	72	12	0.8	3.8	0.8	1.5	3.5	17.8	5.1	22.9	[2]0.1	1.0	19.2

142	Crushed and broken stone (limestone)	20	6	0.3	1.5	0.3	0.6	1.5	8.9	2.4	11.3	(NA)	0.3	8.2
144	Sand and gravel	9	1	0.1	0.5	0.1	0.2	0.5	1.8	0.2	2.0	(NA)	0.1	3.0
145	Clay and related minerals	34	1	0.1	0.5	0.1	0.3	0.5	1.9	0.7	2.6	(NA)	(NA)	(NA)
1492	Gypsum	5	-	(Z)	0.2	(Z)	0.1	0.2	3.6	0.2	3.7	(NA)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

[2] Represents capital expenditures for the dimension stone industry only.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	6,123	7,732	Cost of supplies, total.....million dollars..	2,356.6	2,187.3
With 0 to 19 employees.....do....	5,011	6,700	Supplies used, minerals received for preparation, and purchased machinery.....do....	1,831.8	(NA)
With 20 to 99 employees.....do....	951	897	Cost of resales.....do....	5.8	(NA)
With 100 or more employees.....do....	161	135	Purchased fuels consumed.....do....	47.0	(NA)
All employees (average for year).....1,000..	95.5	113.0	Electric energy:		
Payroll (all employees), total for year.....million dollars..	716.8	734.5	Quantity purchased.....million kw.-hrs..	3,706.5	(NA)
			Cost.....million dollars..	43.6	(NA)
			Generated less sold.....million kw.-hrs..	1,071.3	(NA)
			Contract work.....million dollars..	428.4	528.5
Production, development, and exploration workers:					
Average for the year.....1,000..	63.0	75.7	Value of shipments and receipts (including resales), total.....do....	6,527.4	5,585.6
March.....do....	63.2	(NA)	Value of resales.....do....	10.4	(NA)
May.....do....	63.1	(NA)			
August.....do....	63.8	(NA)			
November.....do....	62.3	(NA)	Value added in mining.....do....	4,990.9	4,245.7
Man-hours.....millions..	131.0	161.2	Capital expenditures (except land and mineral rights), total.....do....	820.0	847.5
Wages.....million dollars..	396.4	428.4	Mineral development and exploration.....do....	319.7	376.7
			New structures and additions.....do....	127.9	
Supplemental labor cost not included in payroll.....do..	59.4	(NA)	New machinery and equipment.....do....	348.0	470.8
			Used plant and equipment.....do....	24.5	
			Mineral development and exploration expenditures, total.....do....	520.0	(NA)
Legally required expenditures, including Social Security contributions.....do..	29.9	(NA)	Capitalized.....do....	319.7	376.7
Payments for voluntary programs.....do..	29.5	(NA)	Expensed.....do....	200.3	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operations in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation to Terms)

State, county, and size class	All mineral industries [1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*

The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

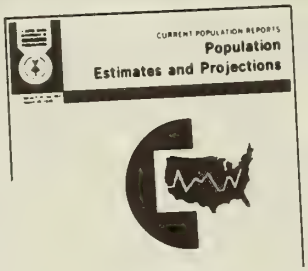
Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

U.S. DEPARTMENT OF COMMERCE/Bureau of the Census

CURRENT POPULATION REPORTS

In addition to the findings of the Census of Population, conducted every ten years, the Bureau of the Census publishes continuing and up-to-date statistics on population counts, characteristics, and other special studies on the American people. Data are issued in the eight separate series of reports described herein and released under the general title, Current Population Reports.



P-20 POPULATION CHARACTERISTICS.

Current national and, in some cases, regional data on geographic residence and mobility, fertility, education, school enrollment, marital status, numbers and characteristics of household and families, etc. Approximately ten reports each year.

P-23 SPECIAL STUDIES.

Infrequent reports on methods, concepts, or specialized data.

P-25 POPULATION ESTIMATES AND PROJECTIONS.

Monthly estimates of the total population of the United States; annual mid-year estimates of the population of States, by broad age groups, and of the United States by age, color, and sex; annual estimates of the components of population change. Estimates of the population selected metropolitan areas and their component counties. Projections of the future population of the United States and individual States. Approximately 20 reports each year.

P-26 FEDERAL-STATE COOPERATIVE PROGRAM FOR POPULATION ESTIMATES.

Population estimates for counties for selected States in which the figures are prepared by a State agency as part of the Federal-State Cooperative Program for Local Population Estimates.

P-27 FARM POPULATION.

(Census-ERS). Data on the size and selected characteristics of the farm population of the United States. Issued jointly with the Economic Research Service, U.S. Department of Agriculture. One or two reports each year.

P-28 SPECIAL CENSUSES.

Results of population censuses taken at the request and expense of city or other local governments. Subscription includes only the quarterly and annual summaries showing the total population figures for all the censuses conducted during the particular period. Individual reports issued for areas of 50,000 or more, showing the population by age, sex, and color are available separately. See "How to Order Reports." Five reports each year.

P-60 CONSUMER INCOME.

Information on the proportions of families and persons at various income levels. Also data on the relationship of income to age, sex, color, family size, education, occupation, work experience, and other characteristics. Two reports each year.

P-65 CONSUMER BUYING INDICATORS.

Information on the proportion of households reporting intentions to purchase automobiles, houses, and household equipment within a particular period of time. Also data on recent purchases. Quarterly.

HOW TO ORDER REPORTS

All Current Population Reports are sold as a single subscription for $14.00 a year. This price includes Series P-20, P-23, P-25, P-26, P-27, P-28 (quarterly and annual summaries only), P-60, and P-65.

Subscriptions to individual series are not sold separately but single copies of reports issued in all series except P-28 may be obtained from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Individual city or area reports in the P-28 series may be ordered from the Bureau of the Census. Prices for these reports vary. For information on titles and prices of individual reports issued in all CPR series, write to Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

6	Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967	10
APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

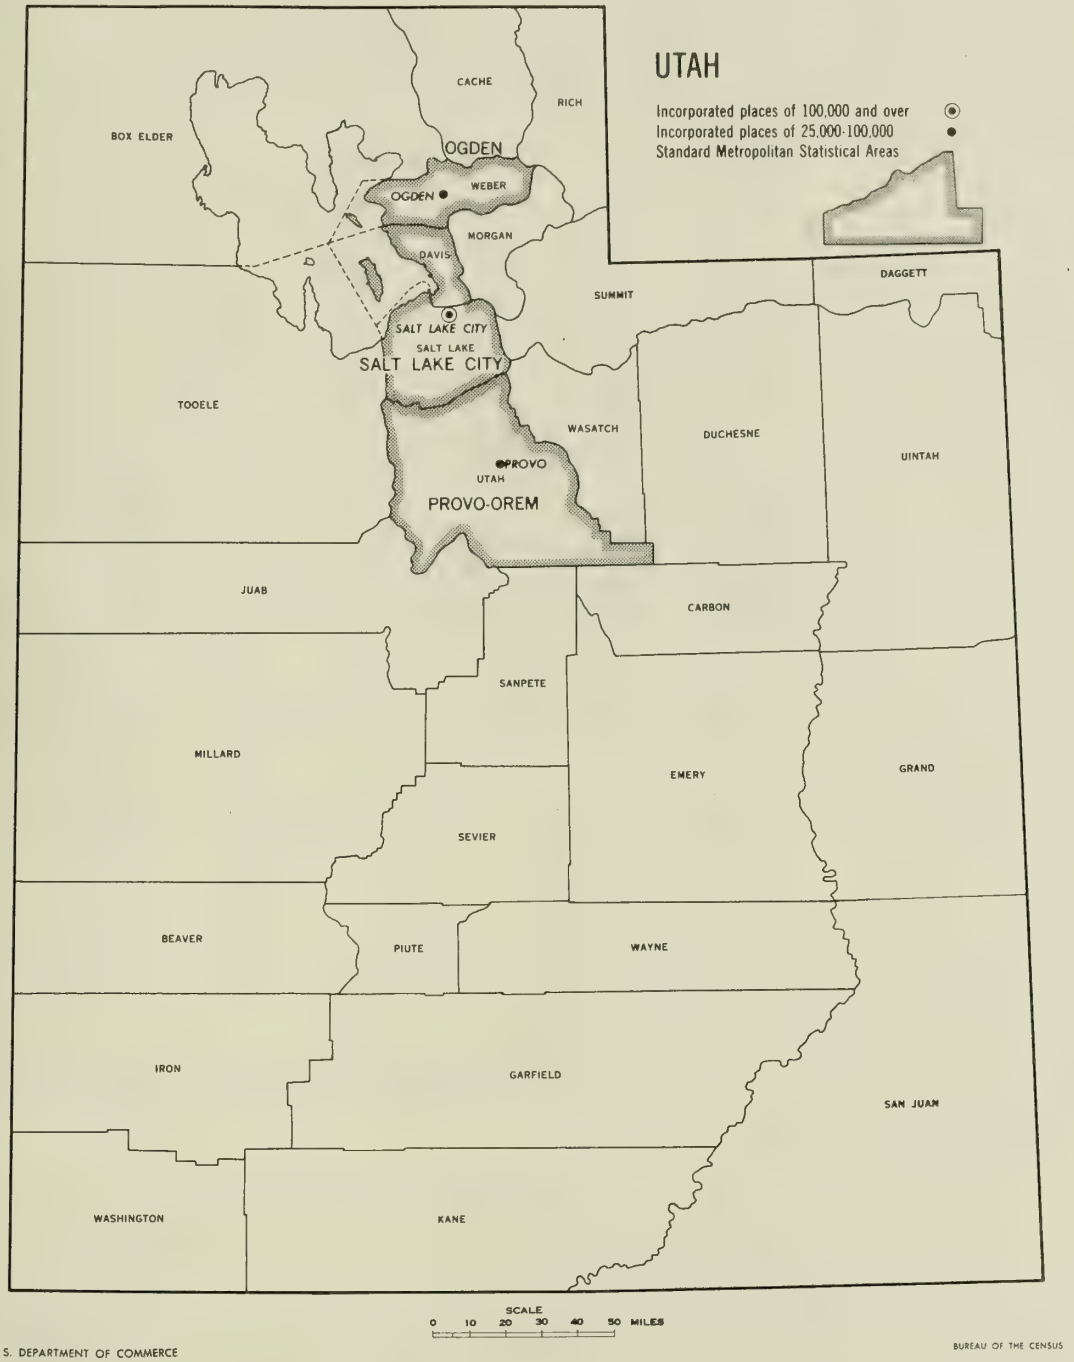
In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:



NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]308	66	8.5	65.7	6.7	13.4	48.3	233.7
1963	[1]384	71	10.7	68.8	9.1	17.3	55.6	267.8
1958	450	79	14.0	79.9	11.6	22.9	62.9	[2]246.2
1954	555	59	12.6	56.6	10.2	19.8	43.3	[2]151.7
Including operations in manufactures:								
1967	323	68	8.6	66.9	6.8	13.7	49.5	237.1
1963	405	72	10.8	69.5	9.2	17.6	56.4	270.7
1958	468	79	14.1	80.3	11.7	23.0	63.2	[2]250.1
1954[3]	562	59	12.7	56.8	10.3	19.9	43.4	[2]153.2
1939	[4]199	(NA)	10.8	16.6	9.5	18.5	13.3	51.6
1925[5]	186	(NA)	13.6	24.6	12.6	(NA)	21.9	62.8
1919[6]	189	(NA)	11.2	19.8	10.2	(NA)	17.8	29.9
1909[6]	504	(NA)	11.7	11.2	11.0	(NA)	9.8	16.1
1902[7]	[4]451	(NA)	7.3	6.8	[8]6.7	(NA)	6.0	9.9

Kind of operation and year	Selected expenses				Value of shipments and receipts[9]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	[10]158.1	([10])	20.0	([10])	357.5	54.3	(NA)
1963	52.5	100.8	35.1	20.8	423.8	53.3	3.8
1958	75.5	101.9	47.2	22.4	428.0	65.1	4.7
1954	39.6	75.6	16.6	10.1	[2]273.5	19.4	3.9
Including operations in manufactures:							
1967	[11]178.6	([11])	([11])	([11])	361.4	[13](NA)	(NA)
1963	[12]53.0	100.8	[12]35.1	[13]20.8	427.1	[13]53.3	[13]3.8
1958	75.8	101.9	[12]47.2	[13]22.4	432.3	[13]65.1	[13]4.7
1954[2]	[12]39.7	75.6	[12]16.6	[13]10.1	[2]275.2	[13]19.4	[13]3.9
1939	11.2	(NA)	.3	(NA)	63.0	(NA)	1.3
1929[4]	18.1	(NA)	2.1	4.2	83.1	(NA)	1.3
1919[5]	10.7	.3	.6	(NA)	41.5	(NA)	[14]1.6
1909[5]	5.5	.1	.4	(NA)	22.1	(NA)	(NA)
1902[6]	2.3	(NA)	.2	(NA)	12.4	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 58 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for the Uranium-Radium-Vanadium Ores Industry.

[3]Excludes data for sand and gravel mining operations in manufacturing establishments.

[4]Represents number of mines and quarries and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[5]Excludes data for oil and gas extraction and common clay and shale operations, if any. In 1939, there were 4 oil and gas extraction operations, and 4 common clay and shale mines with products valued at $35 thousand.

[6]Excludes data for sand and gravel and common clay and shale mining operations and for limestone quarries operated as parts of cement and lime plants. For 1929, 3 such sand and gravel operations were reported with products valued at $255 thousand, and 3 such limestone quarries.

[7]Includes data for one cement plant and for lime plants producing lime valued at $99 thousand.

[8]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[13]Excludes data for mining operations in manufacturing establishments.

[14]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to 37 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	308	66	8.5	65.7	6.7	13.4	48.3	233.7	178.1	357.5	54.3	10.7	267.8

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total	With 20 employees or more	Number[1]	Payroll[1]	Number[1]	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	15	2	0.1	1.2	0.1	0.3	1.2	3.4	0.5	3.9	(NA)	0.1	2.8
144	Sand and gravel	9	1	0.1	1.0	0.1	0.2	1.0	1.6	0.3	1.9	(NA)	(Z)	0.7

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963
Establishments, total.....number..	308	384
With 0 to 19 employees.....do....	242	313
With 20 to 99 employees.....do....	47	55
With 100 or more employees.....do....	19	16
All employees (average for year).....1,000..	8.5	10.7
Payroll (all employees), total for year.....million dollars..	65.7	68.8
Production, development, and exploration workers:		
Average for the year.....1,000..	6.7	9.1
March.....do....	8.5	(NA)
May.....do....	8.7	(NA)
August.....do....	4.9	(NA)
November.....do....	4.7	(NA)
Man-hours.....millions..	13.4	17.3
Wages.....million dollars..	48.3	55.6
Supplemental labor cost not included in payroll.....do..	9.8	(NA)
Legally required expenditures, including Social Security contributions.....do..	3.8	(NA)
Payments for voluntary programs.....do..	6.0	(NA)
Cost of supplies, total.....million dollars..	178.1	209.3
Supplies used, minerals received for preparation, and purchased machinery.....do....	148.8	(NA)
Cost of resales.....do....	.1	(NA)
Purchased fuels consumed.....do....	2.5	(NA)
Electric energy:		
Quantity purchased.....million kw.-hrs..	885.9	(NA)
Cost.....million dollars..	6.8	(NA)
Generated less sold.....million kw.-hrs..	9.6	(NA)
Contract work.....million dollars..	20.0	35.1
Value of shipments and receipts (including resales), total.....do....	357.5	423.8
Value of resales.....do....	.1	(NA)
Value added in mining.....do....	233.7	267.8
Capital expenditures (except land and mineral rights), total.....do....	54.3	53.3
Mineral development and exploration.....do....	24.3	23.2
New structures and additions.....do....	7.1	} 30.1
New machinery and equipment.....do....	22.1	
Used plant and equipment.....do....	.8	
Mineral development and exploration expenditures, total.....do....	34.8	(NA)
Capitalized.....do....	24.3	23.2
Expensed.....do....	10.5	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963

104	Gold and silver ores	1	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

Standard Notes: -Represents zero.
[1]See table 5, footnote 1.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

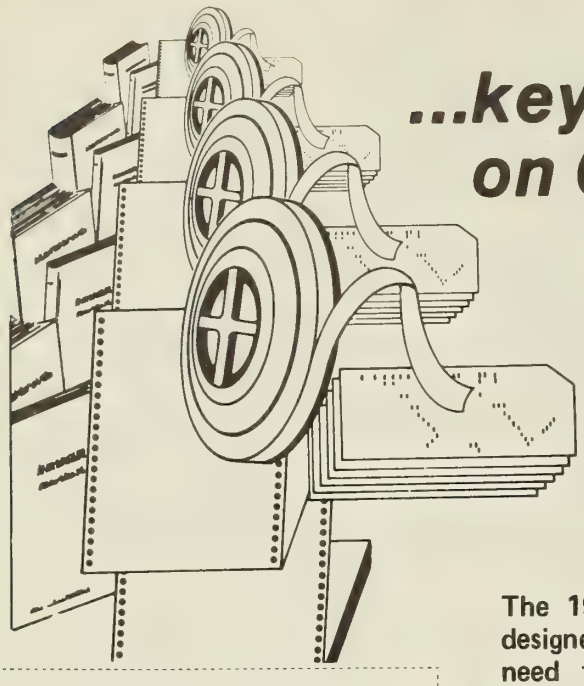
In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*



The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

1970 Census Users' Guide Part 1 and Part 2

The 1970 Census Users' Guide is a two-part publication designed to furnish most of the information data users will need for effective access and use of 1970 census data products.

Part 1 of the **Guide** (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

Part 2 of the **Guide** (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]36	12	.9	5.1	.7	1.6	4.1	11.7
1963	[1]44	10	.8	4.1	.7	1.6	3.4	8.8
1958	41	7	.8	3.2	.7	1.4	2.5	6.8
1954	42	11	1.3	4.9	1.2	2.6	4.2	10.6
Including operations in manufactures:								
1967	51	19	2.0	10.4	1.7	3.6	8.9	20.1
1963	61	14	2.1	9.4	1.9	4.0	8.2	16.4
1958	67	16	2.6	10.0	2.2	4.4	7.9	15.8
1954[2]	62	16	2.1	7.4	1.9	4.0	6.5	15.5
1939[3]	[4]77	(NA)	1.7	2.0	1.6	3.1	1.7	(NA)
1929[5]	105	(NA)	3.4	4.9	3.2	(NA)	4.2	8.9
1919[6]	93	(NA)	3.2	3.5	2.9	(NA)	3.0	6.8
1909[6]	141	(NA)	8.6	4.8	8.2	(NA)	4.5	6.8
1902[7]	[4]192	(NA)	5.8	3.5	[8]5.4	(NA)	3.1	4.8

Kind of operation and year	Selected expenses				Value of shipments and receipts[9] (million dollars)	Capital expenditures (million dollars)	Energy used (kw.-hrs. equivalent) (billions)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)			
Mineral industries only:							
1967	[10]3.6	([10])	.3	([10])	14.8	.9	(NA)
1963	[11]2.7	([11])	.2	.5	11.1	1.0	.1
1958	2.8	-	.2	.4	9.6	.7	.2
1954	[11]3.5	(Z)	.4	.6	14.4	.7	.2
Including operations in manufactures:							
1967	[12]7.4	([12])	([12])	([12])	26.3	1.2	(NA)
1963	[13]6.4	.3	[13].2	[15]1.0	22.6	[15]1.6	(NA)
1958	[14]5.4	([11])	[13].3	[15].9	21.2	[15]1.2	[15].3
1954[2]	[13]4.4	(Z)	[13].6	[15].7	20.4	[15].8	[15].2
1939[3]	1.2	(NA)	Z	(NA)	6.2	(NA)	.1
1929[5]	1.3	(NA)	Z	.3	10.3	(NA)	.2
1919[6]	1.7	-	.1	(NA)	8.6	(NA)	[16].2
1909[6]	1.3	-	.1	(NA)	8.2	(NA)	(NA)
1902[7]	1.1	(NA)	-	(NA)	5.9	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time, data for single unit establishments without paid employees were excluded from the census. In 1963, there were 4 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments. Except for number of establishments, excludes data for one stone quarry operated as part of a lime plant and one clay pit operated as part of a clay products plant.

[3]Except for value of shipments, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing stone at such operations was $895 thousand.

[4]Represents number of mines and quarries.

[5]Excludes data for common clay and shale operations, if any. No such operations were reported for 1939.

[6]Excludes data for sand and gravel operations and stone quarries operated as parts of lime plants. For 1929, there was one sand and gravel establishment and 2 such stone quarries. See also footnote 5.

[7]Excludes data for sand and gravel and common clay and shale operations. Includes data for lime plants producing lime valued at $219 thousand.

[8]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For all other years, represents net production and excludes this duplication.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]Cost of minerals received for preparation is included with cost of supplies, purchases for resale, and purchased fuels and electric energy.

[12]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14]Includes the cost of minerals received for preparation. See also footnote 13.

[15]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

[16]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to 15 percent of the total kw.-hrs. equivalent of of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	36	12	.9	5.1	.7	1.6	4.1	11.7	3.9	14.8	.9	.8	8.8
14	Nonmetallic minerals, except fuels	35	12	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.8	8.8
141	Dimension stone	6	4	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
1413	Dimension granite	5	4	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
142	Crushed and broken stone	9	3	.2	1.1	.2	.3	.8	2.3	.9	3.0	.2	(NA)	(NA)
1422	Crushed and broken limestone	8	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
1423	Crushed and broken granite	1	1	BB	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
144	Sand and gravel	11	1	.1	.5	.1	.2	.4	1.0	.5	1.4	.1	.1	.4
1442	Construction sand and gravel	11	1	.1	.5	.1	.2	.4	1.0	.5	1.4	.1	(NA)	(NA)
149	Miscellaneous nonmetallic minerals	8	4	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
1496	Talc, soapstone, and pyrophyllite	5	3	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
1499	Nonmetallic minerals, n.e.c.	2	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees. n.e.c. Not elsewhere classified.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc.	Value of shipments and receipts[1]	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	15	7	1.1	5.3	1.0	2.0	4.8	8.4	3.5	11.5	[2]0.3	1.2	7.6
1411	Dimension stone (Dimension stone, n.e.c. subindustry)	12	7	1.0	5.2	0.9	2.0	4.7	7.7	3.4	10.8	0.3	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

[2] Represents capital expenditures for the dimension stone industry only.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]	
				Total	Underground mines	Open-pit mines	Combination methods, well operations, and other methods	Total	Underground mines	Open-pit mines	Combination methods and other methods			
	Vermont:

			Expensed.....do....	.4	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

Code	County and industry group	1967											1963	
		Establishments[1]		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	Vermont, total	36	12	.9	5.1	.7	1.6	4.1	11.7	3.9	14.8	.9	.8	8.8
	COUNTIES[2]													
	Lamoille County, total	4	3	(EE)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
14	Nonmetallic minerals, except fuel	4	3	(EE)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
149	Miscellaneous nonmetallic minerals	3	3	(EE)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
	Washington County, total	8	4	(CC)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
14	Nonmetallic minerals, except fuel	8	4	(CC)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
141	Dimension stone	4	3	(CC)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
	Windsor County, total	5	1	(CC)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(Z)	.4
14	Nonmetallic minerals, except fuel	5	1	(CC)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(Z)	.4

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for their own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represent the number of reports received, while county establishment counts represent the number of reports that indicated operations in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)
Vermont, total	36	1	-	-	-	35
0 to 4 employees	14	1	-	-	-	13
5 to 9 employees	6	-	-	-	-	6
10 to 19 employees	4	-	-	-	-	4
20 to 49 employees	6	-	-	-	-	6
50 to 99 employees	5	-	-	-	-	5
100 to 249 employees	1	-	-	-	-	1
Addison county, total	1	-	-	-	-	1
0 to 19 employees	1	-	-	-	-	1
Bennington county, total	1	-	-	-	-	1
0 to 19 employees	1	-	-	-	-	1
Caledonia county, total	1	-	-	-	-	1
0 to 19 employees	1	-	-	-	-	1
Chittenden county, total	8	1	-	-	-	7
0 to 19 employees	6	1	-	-	-	5
20 to 99 employees	2	-	-	-	-	2
Franklin county, total	1	-	-	-	-	1
20 to 99 employees	1	-	-	-	-	1
Lamoille county, total	4	-	-	-	-	4
0 to 19 employees	1	-	-	-	-	1
20 to 99 employees	2	-	-	-	-	2
100 to 249 employees	1	-	-	-	-	1
Orange county, total	3	-	-	-	-	3
0 to 19 employees	2	-	-	-	-	2
20 to 99 employees	1	-	-	-	-	1
Rutland county, total	4	-	-	-	-	4
0 to 19 employees	4	-	-	-	-	4
Washington county, total	8	-	-	-	-	8
0 to 19 employees	4	-	-	-	-	4
20 to 99 employees	4	-	-	-	-	4
Windsor county, total	5	-	-	-	-	5
0 to 19 employees	4	-	-	-	-	4
20 to 99 employees	1	-	-	-	-	1

Standard Notes: - Represents zero.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

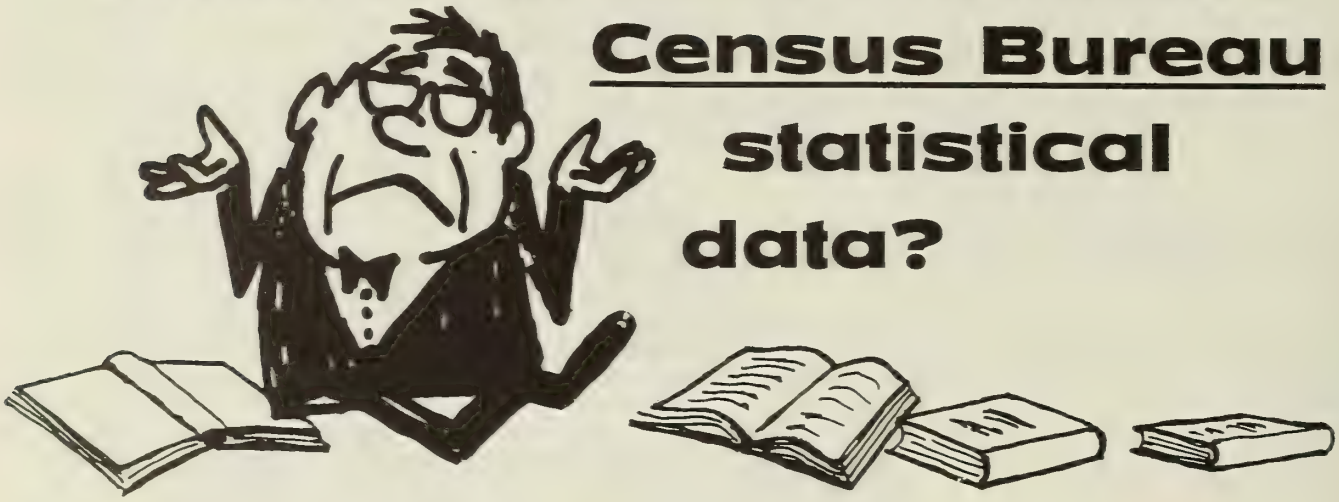
Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*

The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:



All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

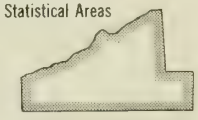
Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification



Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]737	170	13.0	76.5	11.6	21.8	63.9	178.5
1963	[1]944	201	15.6	66.9	14.0	25.5	57.9	144.8
1958	1,033	196	18.0	68.4	15.7	26.4	57.3	135.5
1954	755	153	16.1	52.8	14.4	25.0	45.0	89.1
Including operations in manufactures:								
1967	762	179	13.6	79.1	12.2	23.0	66.4	186.8
1963	985	210	16.2	69.4	14.5	26.7	60.2	151.8
1958	1,066	204	18.6	70.4	16.2	27.5	59.2	142.6
1954[2]	788	164	16.9	55.1	15.1	26.5	47.2	96.0
1939[3]	[4]257	(NA)	20.1	20.9	19.0	29.0	18.9	28.6
1929[5]	193	(NA)	16.1	16.7	15.3	(NA)	14.9	23.9
1919[6]	206	(NA)	15.6	17.9	14.7	(NA)	16.2	23.0
1909[6]	195	(NA)	16.0	5.9	15.4	(NA)	5.3	7.0
1902[7]	[4]194	(NA)	9.5	3.9	[8]8.9	(NA)	3.4	5.4

Kind of operation and year	Selected expenses				Value of shipments and receipts[9] (million dollars)	Capital expenditures (million dollars)	Energy used (kw.-hrs. equivalent) (billions)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)			
Mineral industries only:							
1967	[10]103.7	([10])	10.7	([10])	262.6	30.4	(NA)
1963	42.2	32.8	8.3	11.0	224.1	15.0	3.6
1958	41.1	29.2	12.1	17.8	199.2	36.4	1.6
1954	36.8	[12]10.0	4.5	7.4	137.5	10.3	1.4
Including operations in manufactures:							
1967	[11](D)	([11])	([11])	([11])	272.6	(D)	(NA)
1963	[13]44.1	32.8	[13]8.3	[14]11.0	232.8	[14]15.2	[14]3.6
1958	[13]42.2	29.2	[13]2.1	[14]17.8	207.4	[14]36.4	[14]1.6
1954[2]	[13]38.0	[12]10.0	[13]4.5	[14]7.4	145.6	[14]10.3	[14]1.4
1939[3]	5.9	(NA)	(Z)	(NA)	34.6	(NA)	.7
1929[5]	5.6	(NA)	(Z)	1.1	29.5	(NA)	.8
1919[6]	6.1	-	.3	(NA)	29.4	(NA)	[15]1.6
1909[6]	1.7	-	.1	(NA)	8.8	(NA)	(NA)
1902[7]	.9	(NA)	(Z)	(NA)	6.3	(NA)	(NA)

Note: See appendix A for an explanation of terms used. For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 41 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments, if any.

[3]Except, in part, for value of shipments and value added, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing slate at such operations was $186 thousand; this value has been included in the value of shipments and value added in mining. The comparable values for limestone, granite, marble, trap rock, and sandstone are not available.

[4]Represents number of mines and quarries and, for mining services industries, number of operating companies.

[5]Excludes data for common clay and shale mining operations. In 1939, there were 17 such mines with products valued at $160 thousand.

[6]Excludes data for sand and gravel mining operations and stone quarries operated as parts of cement and lime plants. In 1929, there were 8 such sand and gravel mining operations, with products valued at $679 thousand, and 12 such stone quarries, with products valued at $1,022 thousand. See also footnote 5.

[7]Excludes data for sand and gravel and common clay and shale mining operations, and stone quarries operated as parts of cement plants. Includes data for lime plants producing lime valued at $242 thousand.

[8]Figures for average employment were reduced to a 300-day basis for establishments which operated for a shorter period.

[9]For crushed and broken stone, sand and gravel, clay, and gypsum mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplications due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[10]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies for resale, and purchased fuels and electric energy.

[12]Excludes the cost of natural gas processed at natural gas liquids plants.

[13]For crushed and broken stone, sand and gravel, clay, gypsum, and, for 1963, dimension stone mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14]Excludes data for crushed and broken stone, sand and gravel, clay, gypsum, and for 1963 dimension stone mining operations in manufacturing establishments.

[15]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to 12 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	737	170	13.0	76.5	11.6	21.8	63.9	178.5	114.4	262.6	30.4	15.6	144.8
10	Metal mining	6	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.4	4.4
12	Bituminous coal and lignite mining	577	99	9.5	57.8	8.5	15.2	49.2	131.6	89.3	197.5	23.4	11.5	98.1

144	Sand and gravel	40	11	.7	4.2	.7	1.5	3.4	8.6	4.6	11.6	1.5	.8	8.4
1442	Construction sand and gravel	36	9	.7	3.7	.6	1.3	3.0	8.3	4.2	11.1	1.4	(NA)	(NA)
1443	Glass sand	3	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
145	Clay and related minerals	7	5	.2	1.2	.2	.4	.8	3.8	1.3	4.9	.2	.2	2.1
1459	Clay and related minerals, n.e.c.	6	4	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
149	Miscellaneous nonmetallic minerals	3	2	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1496	Talc, soapstone, and pyrophyllite	1	1	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total	With 20 employees or more	Number[1]	Payroll[1]	Number[1]	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	25	9	0.6	2.6	0.6	1.2	2.5	8.3	(D)	10.0	(D)	0.6	6.9
142	Crushed and broken stone (limestone)	8	5	0.2	1.0	0.2	0.4	1.0	3.8	1.0	4.8	(NA)	(NA)	(NA)
145	Clay and related minerals n.e.c.	12	-	(Z)	0.1	(Z)	0.1	0.1	1.0	0.2	1.2	(NA)	(NA)	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

	Employees.....1,000..	(D)	(D)	-	-	-	-	(D)	-	(D)	(D)	-	-	-
	Value added in mining..mil.dol..	(D)	(D)	-	-	-	-	(D)	-	(D)	(D)	-	-	-

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	737	944	Cost of supplies, total.....million dollars..	114.4	94.3
With 0 to 19 employees.....do....	567	743	Supplies used, minerals received for preparation, and purchased machinery.....do....	91.9	(NA)
With 20 to 99 employees.....do....	151	188	Cost of resales.....do....	2.4	(NA)
With 100 or more employees.....do....	19	13	Purchased fuels consumed.....do....	3.7	(NA)
All employees (average for year).....1,000..	13.0	15.6	Electric energy:		
Payroll (all employees), total for year.....million dollars..	76.5	66.9	Quantity purchased.....million kw.-hrs..	466.9	(NA)
			Cost.....million dollars..	5.7	(NA)
			Generated less sold.....million kw.-hrs..	.8	(NA)
			Contract work.....million dollars..	10.7	8.3
Production, development, and exploration workers:					
Average for the year.....1,000..	11.6	14.0	Value of shipments and receipts (including resales), total.....do....	262.6	224.1
March.....do....	11.4	(NA)	Value of resales.....do....	2.6	(NA)
May.....do....	11.6	(NA)			
August.....do....	11.8	(NA)			
November.....do....	11.6	(NA)	Value added in mining.....do....	178.5	144.8
Man-hours.....millions..	21.8	25.5	Capital expenditures (except land and mineral rights), total.....do....	30.4	15.0
Wages.....million dollars..	63.9	57.9	Mineral development and exploration.....do....	3.0	.5
			New structures and additions.....do....	3.7	
Supplemental labor cost not included in payroll.....do..	9.1	(NA)	New machinery and equipment.....do....	22.1	14.5
			Used plant and equipment.....do....	1.7	
			Mineral development and exploration expenditures, total.....do....	3.5	(NA)
Legally required expenditures, including Social Security contributions.....do..	4.4	(NA)	Capitalized.....do....	3.0	.5
Payments for voluntary programs.....do..	4.8	(NA)	Expensed.....do....	.5	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

12	Bituminous coal and lignite mining.....	107	17	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
121	Bituminous coal and lignite mining.....	107	17	GG	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

State, county, and size class	All mineral industries[1]	Metal mining (M.G. 10)	Anthracite mining (M.G. 11)	Bituminous coal and lignite mining (M.G. 12)	Oil and gas extraction (M.G. 13)	Nonmetallic minerals mining (M.G. 14)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST
- New England
- Middle Atlantic

NORTH CENTRAL
- East North Central
- West North Central

SOUTH
- South Atlantic
- East South Central
- West South Central

WEST
- Mountain
- Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

–	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]185	17	1.6	12.6	1.2	2.3	8.8	21.3
1963	[1]248	22	1.9	11.9	1.5	3.0	9.6	24.5
1958	200	28	2.0	10.9	1.6	2.8	7.9	23.9
1954	287	33	3.1	14.2	2.5	4.7	10.8	[2]22.3
Including operations in manufactures:								
1967	228	19	1.8	14.2	1.4	2.7	10.3	27.2
1963	294	24	2.1	13.3	1.8	3.5	10.9	29.3
1958	239	30	2.2	12.0	1.8	3.2	8.9	28.4
1954[3]	311	35	3.2	14.8	2.6	4.9	11.4	[2]25.2
1939[4]	[5]177	(NA)	4.2	6.2	3.9	6.6	5.4	11.1
1929[6]	141	(NA)	4.4	7.2	4.1	(NA)	6.5	11.1
1919[7]	98	(NA)	5.5	8.3	5.2	(NA)	7.6	10.4
1909[7]	425	(NA)	7.6	3.4	7.4	(NA)	3.1	6.1
1902[8]	[5]241	(NA)	5.5	4.7	[9]5.1	(NA)	4.3	4.4

Kind of operation and year	Selected expenses				Value of shipments and receipts [10]	Capital expenditures	Energy used (kw.-hrs. equivalent)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)	(million dollars)	(million dollars)	(billions)
Mineral industries only:							
1967	12.2	([11])	2.8	([11])	28.7	7.6	(NA)
1963	8.7	.2	3.0	2.5	34.8	4.1	.4
1958	[12]9.5	([12])	2.0	1.6	34.1	2.8	.5
1954	7.5	.2	1.7	2.4	[2]31.4	2.9	.4
Including operations in manufactures:							
1967	[13]15.8	([13])	([13])	([13])	35.5	(NA)	(NA)
1963	[12]9.5	.2	[12]3.0	[14]2.5	40.4	[14]4.1	[14].4
1958	[12]10.1	([12])	[12]2.0	[14]1.6	39.2	[14]2.8	[14].5
1954[3]	[12]8.3	.2	[12]1.7	[14]2.4	[2]35.0	[14]2.9	[14].4
1939[4]	2.6	(NA)	.1	(NA)	13.7	(NA)	.3
1929[6]	2.3	(NA)	(Z)	.7	13.4	(NA)	.5
1919[7]	2.8	-	.1	(NA)	13.3	(NA)	[15]1.6
1909[7]	1.2	.2	(Z)	(NA)	7.5	(NA)	(NA)
1902[8]	.9	(NA)	.1	(NA)	5.4	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 55 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for the Uranium-Radium-Vanadium Ores Industry.

[3]Excludes data for sand and gravel mining operations in manufacturing establishments.

[4]Excludes data for dimension stone dressing, if any, in conjunction with one dimension granite and 2 dimension sandstone quarries.

[5]Represents number of mines and quarries and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[6]Excludes data for common clay and shale operations. There were 10 such mines in 1939 with products valued at $50 thousand. Also, excludes data for oil and gas extraction operations, if any.

[7]Excludes data for sand and gravel operations and for stone quarries operated as parts of cement and lime establishments. In 1929 there were 21 such sand and gravel establishments, with products valued at $1,096 thousand; 5 such stone quarries at cement establishments, with stone products valued at $562 thousand; and 2 such stone quarries at lime establishments. See also footnote 6.

[8]Excludes data for sand, gravel, common clay, and shale operations. Includes data for lime plants producing lime valued at $186 thousand.

[9]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[10]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication.

[11]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[12]For 1958, the cost of minerals received for preparation is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy. For 1963, 1958, and 1954, for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[13]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

[15]Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to 8 percent of the total kw.-hr. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	185	17	1.6	12.6	1.2	2.3	8.8	21.3	15.0	28.7	7.6	1.9	24.5
10	Metal mining	39	4	.4	3.1	.3	.6	2.1	3.6	2.4	5.1	1.0	(D)	(D)
103	Lead and zinc ores	8	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
1033	Zinc ores	3	2	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
104	Gold and silver ores	15	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1042	Lode gold	6	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.2	3.1
12	Bituminous coal and lignite mining	6	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
121	Bituminous coal and lignite mining	6	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1211	Bituminous coal	6	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.2	1.1
13	Oil and gas extraction	18	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.1	(NA)
131	Crude petroleum and natural gas	11	1	.1	.6	(Z)	(Z)	(Z)	(Z)	(D)	.1	(D)	.1	(NA)
1312	Crude petroleum	11	1	.1	.6	(Z)	(Z)	(Z)	(Z)	(D)	.1	(D)	.1	(NA)
138	Oil and gas field services	7	-	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
14	Nonmetallic minerals, except fuels	122	11	1.0	8.1	.8	1.5	5.9	15.6	9.1	21.2	3.6	1.0	(D)
142	Crushed and broken stone	31	3	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.3	4.2
1422	Crushed and broken limestone	10	-	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1429	Crushed and broken stone, n.e.c.	19	3	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	.2	3.4
144	Sand and gravel	61	7	.6	4.5	.5	1.0	3.9	9.3	5.7	13.1	2.0	.5	7.7
1442	Construction sand and gravel	59	7	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(NA)	(NA)
147	Chemical and fertilizer minerals	3	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1475	Phosphate rock	1	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees [1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	33	2	0.2	1.6	0.2	0.4	1.5	5.9	0.8	6.8	(NA)	0.3	4.8
1422	Crushed and broken limestone	4	1	0.1	0.4	0.1	0.1	0.4	1.7	0.3	2.0	(NA)	(NA)	(NA)
144	Sand and gravel	22	1	0.1	0.9	0.1	0.3	0.9	3.6	0.4	4.0	(NA)	0.1	2.9

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Standard Notes: - Represents zero.
[1] See table 5, footnote 1.

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1902[6]	2.5	(NA)	.1	(NA)	25.9	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--West Virginia--Continued

[1]In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 443 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2]Excludes data for sand and gravel mining operations in manufacturing establishments.

[3]Excludes data for dimension stone dressing, if any, in conjunction with one sandstone quarry. For "All operations," includes data for one or two gas field hauling operations, with receipts for services amounting to less than $45 thousand; such operations were not classified in the mineral industries for later years.

[4]Represents number of mines and quarries, number of natural gas liquids plants, and, for the crude petroleum and natural gas and mining services industries, number of operating companies.

[5]Excludes data for sand, gravel, common clay, and shale mining operations and for crushed and broken stone quarries operated as parts of cement and lime establishments. For 1939, the value of products of such establishments (except stone quarries at cement plants) was $2,503 thousand.

[6]Excludes data for sand, gravel, common clay, shale, and nonproducing operations. Includes data for lime plants producing lime valued at $182 thousand and for one cement plant.

[7]Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[8]Excludes data for 3 nonproducing coal mines. See also footnote 3.

[9]Excludes data for one nonproducing establishment.

[10]For years prior to 1958, excludes the cost of natural gas processed at natural gas liquids plants.

[11]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, the figures represent net production and exclude this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants but, for 1954, includes the estimated value prior to processing of natural gas liquids contained in such gas.

[12]Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13]Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14]For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[15]Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

[16]Includes gas purchased for resale without processing.

[17]Excludes purchased electric energy, For "All operations" in 1939, the quantity of purchased electric energy amounted to 10 percent of the total kw.-hrs. equivalent of energy used and for "Excluding oil and gas extraction industries" in 1929, to 11 percent.

[18]Figures for the cost of minerals received for preparation are included with those for cost of supplies, purchases for resale, and purchased fuels and electric energy.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	1,780	341	45.6	337.7	40.4	78.2	288.6	744.4	482.8	1,090.5	136.7	47.6	596.1

1443	Glass sand	2	2	EE	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	West Virginia	8	1	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]	
				Total	Underground mines	Open-pit mines	Combination methods, well operations, and other methods	Total	Underground mines	Open-pit mines	Combination methods and other methods

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:

–	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

1909	1.4	12	(Z)	(NA)	7.5	(NA)	(NA)
1902[7]	.8	(NA)	(Z)	(NA)	4.4	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--Wisconsin--Continued

[1] In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 61 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2] Excludes data for sand and gravel mining operations in manufacturing establishments.

[3] Except, in part, for value of shipments and value added, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing limestone and granite at such operations was $236 thousand; this value has been included in the value of shipments and value added in mining. The comparable value for sandstone is not available. Excludes data for one central office associated with nonproducing operations.

[4] Represents number of mines and quarries.

[5] Excludes data for common clay and shale operations. In 1939, there were 4 such mines with products valued at $34 thousand. See also footnote 6.

[6] Excludes data for one nonproducing establishment.

[7] Includes data for 2 cement plants and for lime plants producing lime valued at $549 thousand.

[8] Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[9] For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishments. For 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For all other years represents net production and excludes this duplication.

[10] Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11] Figures for cost of minerals received for preparation are included with those for cost of supplies, purchases for resale, and purchased fuels and electric energy.

[12] Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[13] For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[14] Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

[15] Excludes purchased electric energy. For such operations in 1939, the quantity of purchased electric energy amounted to only 5 percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
	All mineral operations[1]	236	25	2.4	16.8	1.8	4.0	12.7	37.8	20.0	50.3	7.5	3.1	37.5
10	Metal mining	9	4	.1	.9	.1	.3	.8	3.1	3.0	4.9	1.3	(NA)	5.5
103	Lead and zinc ores	9	4	.1	.9	.1	.3	.8	3.1	3.0	4.9	1.3	(D)	(D)
1033	Zinc ores	8	4	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees[1]	Value added in mining
		Total (number)	With 20 employees or more (number)	Number[1] (1,000)	Payroll[1] (million dollars)	Number[1] (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	36	4	0.3	2.1	0.3	0.6	1.8	5.8	1.3	6.8	[2]0.3	0.4	3.9
	Dimension limestone sub-industry	7	1	0.1	1.0	0.1	0.2	0.8	1.9	0.6	2.1	0.3	(NA)	(NA)
144	Sand and gravel	16	2	0.1	0.6	0.1	0.2	0.6	3.1	0.4	3.5	(NA)	0.1	1.5

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.

Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

APPENDIX	Explanation of Terms	A1

Introduction

GENERAL—This report from the 1967 Census of Mineral Industries is one of a series of area reports which provide statistics for each State and the District of Columbia. In addition to the area series, 14 separate industry or industry-group reports have been issued in the industry series. Reports on special subjects such as size of establishment and type of operation will be published in the subject series.

These separate reports will subsequently be included as portions of the final census volume. The volume, Census of Mineral Industries, will show comparative figures for industries and States on the more important measures of the activity of mining establishments, such as employment, payrolls, value of shipments, capital expenditures, value added in mining, selected materials consumed, and energy used, and will include the 14 reports of individual industries or industry groups. In addition, it will contain area general statistics (number of establishments, employment, payrolls, value added in mining, value of shipments, and capital expenditures) for each State and county, by industry groups and important individual industries.

The "Introduction" to the final volume of the Census of Mineral Industries will discuss at greater length many of the subjects described briefly in this introduction. For example, the volume text will discuss the economic significance of the mining sector; the relation of value added in mining to value added by manufacture; some of the changes in statistical concepts over the history of the census; the valuation problems arising from intracompany transfers between mining establishments of a company and between mining establishments, manufacturing plants, and sales offices and sales branches of a company.

The 1967 census is the 16th census of mineral industries of the United States. The first census of mineral industries covered 1840, and a census was taken at approximately 10-year intervals through 1939, usually in connection with the decennial census of population. A partial census covering the coal industries was conducted in 1935 in cooperation with the U.S. Bureau of Mines as part of the 1935 Census of Business. After World War II, the legislation was changed to provide for a census of mineral industries every 5 years (Title 13, U.S. Code). The minerals censuses which have been taken under this legislation have covered 1954, 1958, and 1963. The current legislation stipulates that the census be conducted covering years ending in "2" and "7." Thus, the next minerals census will be taken in 1973 covering mining activity during 1972.

The 1967 Census of Mineral Industries was conducted jointly with the censuses of business (wholesale, retail, and services) and manufactures, covering the United States, Guam, and the Virgin Islands. Separate censuses of manufactures and business for 1967 were also conducted in Puerto Rico jointly with the Commonwealth Government.

SCOPE OF THE CENSUS OF MINERAL INDUSTRIES: DEFINITION OF MINERAL INDUSTRIES—The 1967 Census of Mineral Industries covers all establishments primarily engaged in mining as defined in the 1967 edition of the *Standard Industrial Classification Manual.* This is the system of industrial classification developed over a period of years by experts on classification in government and private industry under the guidance of the Bureau of the Budget. This system of classification is in general use among government agencies and also outside the government. In 1957, the system was extensively revised although the changes for the mining industries were not very significant.

The *Standard Industrial Classification Manual* defines mining in the broad sense to include the extraction of minerals occurring naturally: Solids, such as coal and ores; liquids, such as crude petroleum; and gases, such as natural gas. The term "mining" is used in the broad sense to include quarrying, well operation, milling (crushing, screening, washing, flotation, etc.), and other preparation needed to render the mineral marketable. Exploration is included as is the development of mineral properties. Services performed on a contract, fee, or other basis in the development of mineral properties are classified separately but within this division.

Mining operations are classified by industry, on the basis of the principal mineral produced or if there is no production, on the basis of the principal mineral for which exploration or development work is in process. The recovery of material from culm banks, ore dumps, and other waste minerals piles is classified in the appropriate mining industry according to the mineral product recovered.

The crushing, grinding, or other treatment of certain earths, rocks, and other nonmetallic minerals not in conjunction with mining activities are not included in this division, but are classified as manufacturing. Hauling and other transportation beyond the mine property and contract hauling (except out of open pits in conjunction with mining) are also excluded.

Statistics on mining operations which are carried on as secondary activities at manufacturing establishments (such as clay pits at clay products plants or sand and gravel operations at ready-mixed concrete plants) are not within the scope of this census. However, selected data (production workers' wages and man-hours; total cost of supplies, fuels, electric energy, and contract work; and quantity of production for mined products) on mining activities at these operations has been obtained in the 1967 Census of Manufactures and are included in the mining reports. Wherever these data are included, they are clearly specified.

ESTABLISHMENT BASIS OF REPORTING—The census of mineral industries is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location; also, companies engaged in distinctly different lines of activity at one location are required to submit separate reports if company records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports differ substantially from those prepared on a company basis; that is, from consolidated reports which not only combine activities at different locations (thereby eliminating interplant transfers) but also include the manufacturing and business activities of companies primarily engaged in mining.

Operating companies were instructed that a mineral establishment, for purposes of the census report, is generally defined as a single physical location where mineral operations are conducted; for example, a mine only, a mine and preparation plant, or a preparation plant only. An establishment in this census, in general, represents workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or pits, however, are not necessarily considered individual establishments.

For oil and gas field operation and contract services, reports were required for units somewhat different from the "establishment" reporting unit used for other types of mining. Every concern which operated oil and gas wells, drilled such wells for its own account or for others, performed oil and gas field services for others during any part of calendar year 1967 was required to submit a separate report for each State, or for each district within Texas, Louisiana, New Mexico, and California (however, information on employment, oil and gas production, and capital expenditures was requested by county). Further, concerns which supplied contract services for others were required to submit a separate report for each State. (In this instance also, information on employment, receipts for services, and capital expenditures was requested by county.)

In 1967, as in recent census years, a minimum size limit was set for including establishments in the census. Data were included for all establishments employing one person or more at any time during the census year. For the first time in 1967, single-unit establishments without paid employees were excluded; however, these establishments for mining as a whole accounted for approximately 1 or 2 percent of value added. In the 1963, 1958, and 1954 censuses, establishments without paid employees were included if value of shipments or expenditures amounted to $500 or more. In the 1939 and 1929 censuses, in general, criteria similar to that used in 1963, 1958, and 1954 were applied except that the cutoff for shipment or expenditures was $2,500. For 1919, the criteria used were $500 on value of products, and $5,000 on expenditures for development work. Minimums for size of establishment included were not provided for censuses prior to 1919. These changes in the minimum size limit do not appreciably affect the historical comparability of the census figures except for statistics on number of establishments.

The production of minerals, particularly stone, sand, and gravel, by Federal, State, and local governments is excluded from the census. Also excluded is some production of these items by highway and construction contractors who do not maintain separate records for sand and gravel production. The census includes, however, mining establishments operated entirely to serve other establishments of the same company, such as coal mines serving only coke ovens operated by the same company, oil and gas wells serving only refineries or public utilities owned by the same company, and copper mines and treatment plants where all of the ore is transferred to a company-owned smelter.

THE CENSUS REPORT FORMS—The 1967 Census of Mineral Industries was primarily a mail canvass; whereas the 1963, 1958, and 1954 censuses were completely on a mail basis. Ten different report forms were used to canvass the 53 mining industries.

From the administrative records of the Social Security Administration and existing Bureau of the Census records, it was possible to determine correctly, in most cases, the type of form each mining establishment should receive.

In the 1967 census, for the first time, approximately 10,000 single-unit establishments with one to four employees were excused from filing reports. Under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration and the Internal Revenue Service were made available to the Census Bureau for use in the 1967 censuses of business, manufactures, and mineral industries. Estimates for data other than payrolls and sales for these small establishments were constructed from industry averages. The effect on industry aggregates is slight in most industries. For mining as a whole, they account for less than 1 percent of value added.

INDUSTRY AND TYPE-OF-OPERATION CLASSIFICATIONS OF ESTABLISHMENT—Each of the establishments covered in the census was classified in one of 53 mineral industries in accordance with the industry definitions in the Standard Industrial Classification (SIC) system. Under this system of classification, an industry is generally defined as a group of establishments producing a single product or a more or less closely related group of products. The resulting group of establishments must be significant in terms of their number, value added in mining, value of shipments, and number of employees. The application of these criteria has led to the establishment of 53 mining industries. For each industry, a 4-digit number is assigned. The classification system also provides broader groups of industries, with 20 3-digit groups and 5 2-digit groups. Within industries, the system provides for 7-digit products and 5-digit product classes. These are considered the primary products of the industry if the product code begins with the same first four digits as the industry code. An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. (For service industries, the classification is on the basis of receipts for services performed.)

As in earlier censuses, a number of small establishments may have been misclassified as to industry. However, such possible misclassifications have no significant effect on the statistics other than the number of establishments. As indicated above, report forms were not mailed to very small establishments (less than five employees). The industry classifications for these establishments were assigned on the basis of brief descriptions of the general activity of the establishment. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. The general statistics shown for an industry, therefore, reflect not only the primary activities of an establishment in that industry but also its activities of a secondary nature.

In most industries, establishments making products falling into the same industry category use a variety of processes. Separate statistics are provided on the various types of operation. Wherever possible, separate figures are shown for establishments using underground mining methods only, using open-pit methods

only, and using a combination of underground and open-pit methods. For selected industries, separate statistics are provided by type of underground mining, such as for establishments having as the dominant method open stoping, shrinkage stoping, square setting, or block caving. Separate figures are provided, where possible, for mines with and without preparation plants, for establishments with preparation plants only, and for establishments with preparation plants classified by the dominant preparation method, such as crushing, washing, flotation, or gravity concentration. Separate statistics are also provided on producing and nonproducing operations; an establishment being defined as nonproducing if no mineral products were shipped during the year. For the crude petroleum and natural gas industries, details were obtained on the type of wells drilled and operated and reports were classified on the basis of whether they represented only oil wells, both oil and gas wells, or only gas wells, and on the basis of whether or not they drilled wells.

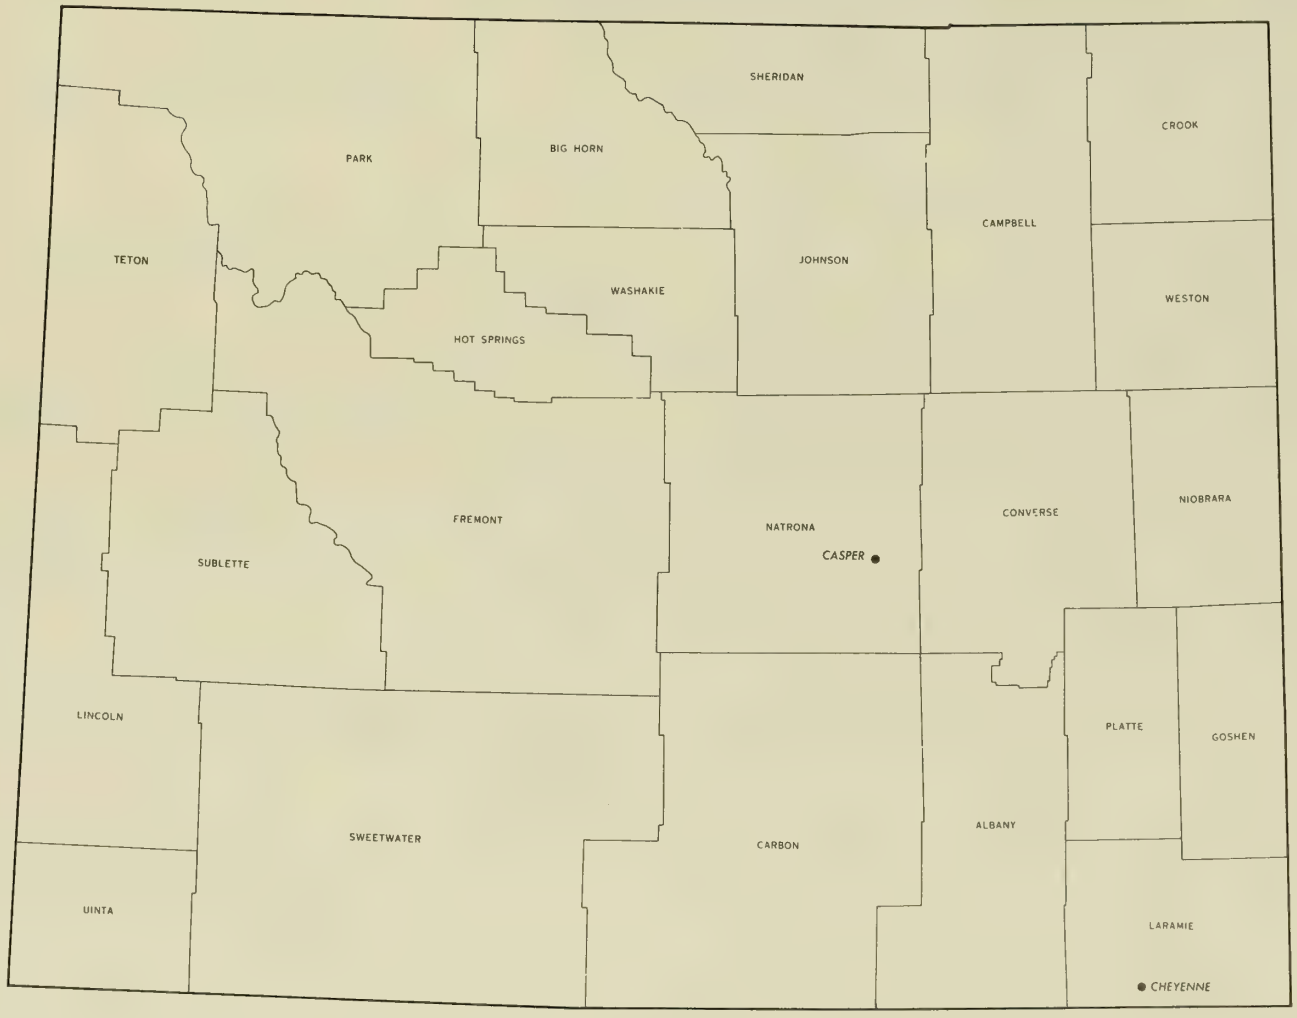
CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES—The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States and States are given precedence over counties. In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because it was considered preferable to show (1) regional figures for an industry, even at the cost of withholding figures for some States (usually the least significant) in a region, rather than to show all publishable figures for the individual States, and group all "disclosure" States in the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) industry group statistics rather than individual industries within each State; thus, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions, in order to show all establishments by some geographic grouping. For this purpose, the following combinations of census divisions have been used:

NORTHEAST	SOUTH
New England	South Atlantic
Middle Atlantic	East South Central
	West South Central
NORTH CENTRAL	WEST
East North Central	Mountain
West North Central	Pacific

ABBREVIATIONS—The following abbreviations and symbols occur frequently, both in the tables and footnotes:



—	zero
X	not applicable
NA	not available
D	withheld to avoid disclosing figures for individual companies
n.e.c.	not elsewhere classified
n.s.k.	not specified by kind
kw.-hrs.	kilowatt-hours
equiv.	equivalent
SIC	Standard Industrial Classification

Other abbreviations, such as lb., gal., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 lbs.; where the figures are expressed in tons of 2,240 lbs., the unit of measure is specified as "long tons."

The 1963 figures shown in the industry reports include a few revisions of previously published 1963 census totals and are comparable with the 1967 figures unless otherwise noted.

TABLE 1. General Statistics: 1967 and Earlier Years

(See appendix, Explanation of Terms)

Kind of operation and year	Establishments		All employees		Production, development, and exploration workers			Value added in mining
	Total (number)	With 20 employees or more (number)	Total (1,000)	Payroll (million dollars)	Total (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)
Mineral industries only:								
1967	[1]447	99	8.7	64.8	6.8	14.3	47.2	501.8
1963	[1]532	101	8.7	60.9	6.6	14.1	43.8	453.1
1958	489	86	8.5	48.5	6.0	11.9	30.6	342.4
1954	483	101	9.7	45.7	7.5	14.6	32.4	[2]258.2
Including operations in manufactures:								
1967	455	99	8.7	64.9	6.8	14.3	47.3	502.1
1963	541	101	8.7	61.1	6.7	14.2	43.9	453.8
1958	501	86	8.6	48.7	6.0	12.0	30.8	343.2
1954[3]	487	101	9.7	45.8	7.5	14.6	32.5	[2]258.5
1939	[4]188	(NA)	6.8	10.4	6.2	10.2	8.8	32.7
1919[5]	121	(NA)	10.4	16.2	9.8	(NA)	14.7	33.1
1909[5]	130	(NA)	8.2	7.0	7.9	(NA)	6.4	8.6
1902[6]	[4]150	(NA)	5.0	4.0	[7]4.8	(NA)	4.8	4.6
Excluding oil and gas extraction industries:								
1967	95	35	3.6	26.5	2.9	6.1	20.5	94.6
1963	130	41	3.5	22.8	2.7	5.9	17.5	84.4
1958	145	23	2.5	12.3	2.0	3.8	9.6	44.0
1954[3]	117	24	2.6	10.2	2.3	3.9	8.7	32.2
1939	[3]90	(NA)	4.8	6.6	4.5	6.5	5.9	10.9
1929[8]	66	(NA)	5.6	10.4	5.4	(NA)	9.8	15.9
1919[5]	71	(NA)	7.9	12.0	7.5	(NA)	11.1	16.5
1909[5]	116	(NA)	8.2	6.9	7.9	(NA)	6.4	8.8

Kind of operation and year	Selected expenses				Value of shipments and receipts[9] (million dollars)	Capital expenditures (million dollars)	Energy used (kw.-hrs. equivalent) (billions)
	Supplies, fuels, purchases for resale, and purchased electric energy (million dollars)	Minerals received for preparation (million dollars)	Contract work (million dollars)	Purchased machinery installed (million dollars)			
Mineral industries only:							
1967	[10]164.1	([10])	50.4	([10])	625.9	90.4	(NA)
1963	[11]107.4	([11])	49.9	26.5	560.6	76.3	10.1
1958	43.8	16.4	49.7	18.7	404.9	66.1	7.2
1954	43.4	[12]1.4	56.1	25.3	[2]313.0	71.5	9.5
Including operations in manufactures:							
1967	[13]164.2	([13])	([13])	([13])	626.2	(NA)	(NA)
1963	[11] [14]107.6	([11])	[14]49.9	[15]26.5	561.5	[15]76.3	[15]10.1
1958	[14]43.9	16.4	[14]49.7	[15]18.7	405.9	[15]66.1	[15]7.2
1954[3]	[14]43.8	[12]1.4	[14]56.1	[15]25.3	313.7	[15]71.5	[15]9.5
1939	3.0	(NA)	3.2	(NA)	38.9	(NA)	1.9
1919[5]	7.9	[16].1	.8	(NA)	41.9	(NA)	[17]2.7
1909[5]	1.9	-	.1	(NA)	10.6	(NA)	(NA)
1902[6]	1.0	(NA)	.1	(NA)	5.7	(NA)	(NA)
Excluding oil and gas extraction industries:							
1967	[13]50.7	([13])	([13])	([13])	123.1	(NA)	(NA)
1963	[11] [14]37.3	([11])	[14]6.6	[15]4.3	125.7	[15]6.7	[15]2.3
1958	[14]10.3	11.5	[14]10.6	[15]2.6	66.6	[15]12.3	1.2
1954[3]	[14]7.0	.3	[14]2.4	[15]1.0	[2]41.8	[15]1.1	[15]1.4
1939	2.2	(NA)	(Z)	(NA)	13.1	(NA)	.9
1929[8]	2.9	(NA)	(Z)	.6	18.8	(NA)	1.4
1919[5]	3.4	-	.1	(NA)	20.0	(NA)	[17]1.8
1909[5]	1.7	-	.1	(NA)	10.6	(NA)	(NA)

Note: For more detailed historical statistics for this State, see table 1 of the corresponding chapter of the 1954 Census of Mineral Industries, Vol. II. For all years prior to 1939, excludes contract service operations.

Footnotes continued on next page.

TABLE 1. General Statistics: 1967 and Earlier Years—Continued

Footnotes for table 1--Wyoming--Continued

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

[1] In 1967, for the first time data for single unit establishments without paid employees were excluded from the census. In 1963, there were 73 single unit establishments without paid employees in this State. In the 1963 census establishments without paid employees for mining as a whole accounted for approximately 3 percent of value added.

[2] Excludes data for the Uranium-Radium-Vanadium Ores Industry.

[3] Excludes data for sand and gravel mining operations in manufacturing establishments.

[4] Represents number of mines and quarries, number of natural gas liquids plants, and for the crude petroleum and natural gas and mining services industries, number of operating companies.

[5] Excludes data for sand, gravel, common clay, and shale operations and stone quarries operated as parts of cement plants. There were 3 such sand, gravel, common clay, and shale mines in 1939, with products valued at $56 thousand. For 1929, only one sand and gravel establishment, and one stone quarry at a cement plant, was reported. For "Excluding oil and gas extraction industries" in 1909, except for number of establishments, includes data for 7 nonproducing crude petroleum and natural gas establishments. For 1902, only 2 oil and gas extraction operations were replaced, hence, figures cannot be shown excluding such operations.

[6] Includes data for lime plants producing lime valued at $2 thousand. See also footnote 5.

[7] Figures for average employment were converted to a 300-day basis for establishments which operated for a shorter period.

[8] Excludes data for common clay and shale mines. Only one such mine was reported for 1939.

[9] For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments, includes the estimated value of minerals produced and used in the same establishment in making manufactured products. For 1967, 1963, 1958, 1954, 1919, and 1909, represents gross value of shipments (or production for 1919 and 1909) and contains some duplication due to the transfer of crude minerals from one establishment to another for preparation. The approximate magnitude of this duplication is indicated by the figures shown for cost of minerals received for preparation. For other years, represents net production and excludes this duplication. For years prior to 1958, excludes the value of residue gas from natural gas liquids plants.

[10] Data for minerals received for preparation and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[11] Figures for minerals received for preparation are included with those for supplies, purchases for resale, and purchased fuels and electric energy.

[12] Excludes the cost of natural gas processed at natural gas liquids plants, but includes the estimated value prior to processing of natural gas liquids contained in such gas.

[13] Data for minerals received for preparation, contract work, and purchased machinery installed are included with supplies, purchases for resale, and purchased fuels and electric energy.

[14] For crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments the cost of contract work is included with the cost of supplies, purchases for resale, and purchased fuels and electric energy.

[15] Excludes data for crushed and broken stone, sand and gravel, and clay mining operations in manufacturing establishments.

[16] Represents natural gas purchased for use as a material and for resale.

[17] Excludes purchased electric energy. For 1929, the quantity of purchased electric energy amounted to only one percent of the total kw.-hrs. equivalent of energy used.

TABLE 2A. General Statistics for Mineral Establishments, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development, and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total (number)	With 20 employees or more (number)	Number (1,000)	Payroll (million dollars)	Number (1,000)	Man-hours (millions)	Wages (million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)

1474	Potash, soda, and borate minerals	4	2	FF	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)
1475	Phosphate rock	1	1	CC	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Industries and industry groups with less than 50 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 50 or more employees which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

BB - 50-99 employees
CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 2B. General Statistics for Manufacturing Establishments With Mining Operations, by Industries: 1967 and 1963

(See appendix, Explanation of Terms)

Code	Industry	1967											1963	
		Establishments		All employees		Production, development and exploration workers			Value added in mining	Cost of supplies, etc., and purchased machinery installed	Value of shipments and receipts	Capital expenditures	All employees	Value added in mining
		Total	With 20 employees or more	Number[1]	Payroll[1]	Number[1]	Man-hours	Wages						
		(number)	(number)	(1,000)	(million dollars)	(1,000)	(millions)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(million dollars)	(1,000)	(million dollars)
14	Nonmetallic minerals, except fuels	8	-	(Z)	0.1	(Z)	(Z)	0.1	0.3	0.1	0.3	(NA)	(Z)	0.7

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

[1] For crushed and broken stone, sand, and gravel, and clay mining operations in manufacturing establishments, the number of production, development, and exploration workers was estimated from reported figures for man-hours. No data were obtained on other employees at such operations; hence the same employment and payroll figures are included for all employees as for production, development, and exploration workers. Value of shipments and receipts data is an estimate based on mineral products produced, whether sold, transferred, added to inventories, or used in further processing.

TABLE 3. Selected Statistics for Mineral Industries, by Type of Operation and Industry Groups: 1967

(See appendix, Explanation of Terms)

Code	Industry group or industry and item	All types of establishments, total	Producing establishments										Nonproducing establishments
			Total	Mines only				Mines with preparation plants				Separately operated preparation plants	Undistributed[1]

	Employees.....1,000..	(Z)	(Z)	(D)	-	(D)	-	(D)	-	(D)	-	-	-	-
	Value added in mining..mil.dol..	(Z)	(Z)	(D)	-	(D)	-	(D)	-	(D)	-	-	-	-

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.
[1] Includes data for central administrative offices and auxiliary units in addition to plants where it was not possible to classify the plant based on the information available.

TABLE 4. Detailed Statistics: 1967 and 1963

(See appendix, Explanation of Terms)

Item	1967	1963	Item	1967	1963
Establishments, total.....number..	447	532	Cost of supplies, total.....million dollars..	214.5	183.8
With 0 to 19 employees.....do....	348	431	Supplies used, minerals received for preparation, and purchased machinery.....do....	144.8	(NA)
With 20 to 99 employees.....do....	80	85	Cost of resales.....do....	1.0	(NA)
With 100 or more employees.....do....	19	16	Purchased fuels consumed.....do....	8.4	(NA)
All employees (average for year).....1,000..	8.9	8.7	Electric energy:		
			Quantity purchased.....million kw.-hrs..	880.9	(NA)
Payroll (all employees), total for year.....million dollars..	66.8	60.9	Cost.....million dollars..	9.9	(NA)
			Generated less sold.....million kw.-hrs..	165.4	(NA)
Production, development, and exploration workers:			Contract work.....million dollars..	50.4	49.9
Average for the year.....1,000..	6.8	6.6	Value of shipments and receipts (including resales), total.....do....	625.9	560.6
March.....do....	6.6	(NA)	Value of resales.....do....	1.5	(NA)
May.....do....	6.5	(NA)			
August.....do....	7.0	(NA)	Value added in mining.....do....	501.8	453.1
November.....do....	7.2	(NA)			
			Capital expenditures (except land and mineral rights), total.....do....	90.4	76.3
Man-hours.....millions..	14.3	14.1	Mineral development and exploration.....do....	38.1	40.6
			New structures and additions.....do....	10.0	35.7
Wages.....million dollars..	47.2	43.8	New machinery and equipment.....do....	41.0	
			Used plant and equipment.....do....	1.2	
Supplemental labor cost not included in payroll.....do..	7.4	(NA)			
			Mineral development and exploration expenditures, total.....do....	55.4	(NA)
Legally required expenditures, including Social Security contributions.....do..	3.4	(NA)	Capitalized.....do....	38.1	40.6
Payments for voluntary programs.....do..	4.0	(NA)	Expensed.....do....	17.3	(NA)

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.
(Z) Less than $50 thousand or 50 employees.

TABLE 5. General Statistics by County and Industry Groups: 1967 and 1963

(See appendix, Explanation of Terms)

138	Oil and gas field services..	23	1	.1	.6	.1	.2	.5	1.4	.6	1.9	.1	.2	1.6

Note: For 1963, county industry detail for total employment may not add to county totals because of the inclusion of central administrative employees and payroll in the county total but not in the county industry detail.

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than $50 thousand or 50 employees.

[1] Companies which operated oil and gas wells, drilled such wells for its own account or for others, performed exploration work for oil and gas, or performed oil and gas field services for others were required to submit a separate report for each State or for each district within Texas, Louisiana, New Mexico, and California. Further, companies which supplied contract services for others were required to submit a separate report for each State. On each of the 1967 State and district reports, data on employment, oil and gas production or service receipts, and capital expenditures were requested by county. Therefore, the State total figures shown for the number of establishments represents the number of reports received, while county establishment counts represent the number of reports that indicated operation in the specified county. County data not reported on separate reports were obtained by allocating data on State or district reports on the basis of reported county data.

[2] Industries and industry groups with less than 100 employees are omitted. They are included, however, in higher-level totals. For industries and industry groups with 100 employees or more which cannot be shown because they would disclose figures for individual companies, the number of establishments is shown and the employment size range is indicated by one of the following symbols:

CC - 100-249 employees
EE - 250-499 employees
FF - 500-999 employees
GG - 1,000-2,499 employees
HH - 2,500 and over employees

TABLE 6. Number of Mineral Establishments in Major Industry Group, by Employment Size Class and County: 1967

(See appendix, Explanation fo Terms)

Appendix A

EXPLANATION OF TERMS

Employment and Related Items—The standard report forms requested separate information on production, development, and exploration workers as of a payroll period for each quarter of the year; other employees as of the 12th of March. The categories defined on the questionnaire are as follows:

All employees.—The category "all employees" comprises all full-time and part-time employees on the payrolls of mining establishments who worked or received pay for any part of the pay period which included the 12th of the months specified on the report form. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Also included are employees of miners paid on a per ton, car, or yard basis. Excluded are employees at the mine but on the payroll of another employer (such as employees of contractors) and employees at company stores, boarding houses, bunk houses, and recreational centers. Also excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees, but proprietors and partners of unincorporated firms are excluded.

Production, development, and exploration workers—This category includes employees (up through the working foreman level) engaged in manual work: using tools, operating machines, hauling materials, loading and hauling products out of the mine in mine cars or trucks, and caring for mines, plants, mills, shops, or yards. Included are exploration work, mine development, storage, shipping, maintenance, repair, janitorial, and watchmen services, auxiliary production for use at establishments (such as power plant), recordkeeping, and other services closely associated with these production and development operations at the establishment covered by the report. Gang and straw bosses and foremen who performed manual labor are included, as are employees paid on either a time- or piece-rate basis. Also included are miners paid on a per ton, car, or yard basis and the men engaged by them and paid out of the total amount received by these miners, and other employees at the establishment but not on its payroll if paid directly through its own employees, such as superintendents and foremen. Supervisory employees above the working foreman level are excluded from this category.

All other employees—Nonproduction personnel at the establishment include those engaged in the following activities: Supervision above the working foreman level, sales, highway trucking (by employees not entering mines or pits), advertising, credit, collection, clerical, and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria and medical), professional (such as engineers and geologists), and technical activities. Also included are employees on the payroll of the establishment engaged in the construction of major additions or alterations to the plant and who are utilized as a separate work force. (Workers engaged in regular maintenance and repair operations are not included here but are classified as production, development, and exploration workers.)

Central administrative office and auxiliary unit employees—Employees at an office located at or near the mining establishment are usually included in the mine report. Employment during the payroll period which included March 12 at separate central administrative offices or auxiliary units of multiestablishment companies and at those offices or units servicing more than one establishment were classified on the basis of the industry or principal industry served.

Mining Employees: Average Employment—The 1967 census report forms requested employment figures for "production, development, and exploration workers" for four selected pay periods (mid-March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" is composed of an average of the four monthly figures for "production, development, and exploration workers" plus the March figure for "all other employees."

This approach was used to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay periods approximates closely, for most industries, the average employment for the year that would be obtained from 12 monthly pay periods. In the employment data shown in this report, the 4-month average is shown for all industries.

Mining Employees: Payrolls—This total includes the gross earnings paid in the calendar year 1967 to all employees on the payroll of reported establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation. It excludes payments to the proprietor or partners, if an unincorporated concern. Excluded are payments to members of Armed Forces and pensioners carried on the active payroll of mining establishments. Also excluded are royalty payments to unions and costs of smithing, explosives, fuses, electric cap lamps, and mine supplies used in production and development work but charged to employees and deducted from their wages.

The 1967 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is the same as the 1958 and 1963 census definition. It should be noted that this definition does not include employers' Social Security contributions or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment and establishment figures, the annual payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are included in the totals for individual industries and in State totals.

Production, Development, and Exploration Workers Man-Hours—This total consists of all man-hours of production, development, and exploration workers as defined above which were worked both on active days on which there was production or development work, and on inactive days when only watchmen, inspectors, repairmen, and other maintenance men were on duty. It represents all man-hours worked or paid for at the establishment including actual overtime hours (not straight-time equivalent hours). It *excludes* hours paid for vacations, holidays, or sick leave, when the employee was not at the establishment. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Cost of Supplies, Etc., and Purchased Machinery—A summary inquiry on the 1967 census report forms requested information on the cost of supplies, purchased machinery, minerals received for preparation, the cost of products purchased for resale, purchased fuels, and electric energy actually used during the year by each establishment, withdrawn from inventories, or received from other establishments of the company; and the cost of contract work. "Cost" refers to direct charges actually paid or payable for items used during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring these materials.

To arrive at the industry total "cost of supplies, etc.," separate figures were obtained for (a) the total delivered cost of all supplies used, minerals received for preparation, and purchased machinery installed; (b) the amount paid for electric energy purchased; (c) the amount paid for all purchased fuels used for heat, power, or the generation of electricity; (d) the cost of work done by others on a contract, fee, or other basis for the account of the establishments (contract work); and (e) the cost of products bought and resold without further processing. The total excludes the cost of other services used, such as advertising, insurance, telephone, etc., and research and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc. It includes supplies, machinery, and equipment used in development and exploration of mineral properties and in capitalized repairs.

In the case of the cost reported for supplies, minerals for preparation, and purchased machinery received from other establishments of the same company or from a central supplies depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that such reported costs equal the value of shipments reported for the company's establishment producing and transferring the product, plus freight and other direct charges.

It should be noted that the cost of purchased fuel used under "c" above does not include fuels received for preparation, such as coal received for cleaning. Such costs were included in category "a" above.

Individual Supplies Used—In addition to the total cost of supplies, etc., and purchased machinery which every establishment was required to report, information was also collected on the consumption of major supplies used in mining. These supplies inquiries were restricted to those supplies which were important parts of the cost of production, exploration, and development of a particular industry and for which cost information was available from the firms' records. Information regarding the specific supplies consumed is shown in table 7.

Minerals for Preparation—On report forms for almost all mineral industries, except the petroleum and natural gas and contract services industries, a uniform inquiry was included on minerals prepared or treated at the reported establishments. Separated quantity figures were obtained on minerals prepared from three sources: (1) Crude minerals mined at the establishment (quantity); (2) crude minerals received from other establishments of the company or purchased from others (quantity and cost); and (3) crude minerals received for preparation on a custom or toll basis (quantity and estimated value).

Establishments consuming less than a specified amount (usually $5,000) were not requested to report the cost of a supply separately. Also, the cost of supplies for small establishments for which administrative records were used were imputed as "not specified by kind." (See text for importance of administrative records in the industry.)

Energy Used—The 1967 Census of Mineral Industries obtained data on the quantity and cost of fuels and electric energy used in mining which are comparable, in general, to such data obtained in the 1963, 1958, 1954, 1939, 1929, and 1919 censuses. For most industries, separate quantity and cost figures were provided on purchased coal, fuel oil, gas, gasoline, and electric energy, and a cost figure was obtained for other fuels.

To supplement the data on energy and energy materials purchased, data were obtained on the quantity of such items produced and consumed at the same establishment. In the minerals census, such data were obtained on coal, crude petroleum, and natural gas used at the producing establishment for power and heat, and for electric energy generated and used at the same mining operation. For electric energy, the figures actually collected represented total quantity generated (excluding generating-station use), and the quantity of electric energy sold. The difference between the sum of the first two quantity figures and the last figure represents approximate electric energy generated and used.

Capital Expenditures—In the 1967 census, mining companies were asked to report expenditures made during the year for development and exploration of mineral properties, for new construction, and for machinery purchased at their operations that were chargeable to fixed-assets accounts of the mining establishments and were of a type for which depreciation, depletion, or Office of Minerals Exploration accounts are ordinarily maintained. Capital expenditures during 1967 were to be determined as "additions completed during the year plus work in progress at the end of the year minus work in progress at the beginning of the year." Reported capital expenditures were to include work done on contract as well as by the mine forces. Expenditures for machinery and equipment were to include those made for replacement purposes as well as those for additions to capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense. Also excluded are expenditures for land and mineral rights.

Wherever applicable, separate figures were provided on expenditures for (a) development and exploration of mineral property, (b) preparation (or treatment) plant construction and other construction, (c) new machinery and new equipment (including capitalized repairs and improvements), and (d) used plant and used equipment acquired from others.

Value of Shipments and Receipts and Net Shipments—The amounts shown as value of shipments for each industry (tables 1 to 5), and for individual products or classes of products (table 6), are the net selling values, f.o.b. mine or plant, after discounts and allowances, and excluding freight charges.

"Shipments" include all products physically shipped from the establishment during 1967 including material withdrawn from stockpiles and products shipped on consignment, whether or not sold in 1967. Prepared material or concentrates include preparation from ores mined at the same establishment, purchased, received from other operations of the same company, or received for milling on a custom or toll basis. For products transferred to other establishments of the same company or prepared on a custom basis, the company was requested to report the estimated value, not merely the cost of producing the items.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; that is, to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

The figures for "value of shipments and receipts" of an industry include, for all establishments classified in the industry, (a) the value of all "primary" products of the industry, (b) the value of "secondary" products which are primary to other industries, (c) the receipts for contract work done for others (except custom milling), and (d) the value of products purchased and resold without further processing. Receipts for custom milling are omitted from this total to avoid duplication with the value of custom milled ores included in "a" or "b."

For industry and industry-group totals, some duplication is introduced by the inclusion of materials transferred from one establishment to another for mineral preparation or resale. In general, where this duplication is significant, figures are shown for both "gross" and "net" shipments. The net shipments are obtained by subtracting the value of crude minerals transferred to other establishments for preparation and the value of resales from the gross shipments.

Comparable figures for gross and net shipments are available for 1963, 1958, and 1954. For years prior to 1954, data on shipments were not collected. Instead, the report forms requested data on the quantity and value of production. In general, the data for these years were edited to represent net production, excluding duplications because of mining and later milling of the same material.

Individual Products—In the 1967 Census of Mineral Industries, information was obtained on about 225 individual mineral product items. Product detail provides broad-level data on crude and prepared minerals. These figures serve as tie-lines to the correspondingly more detailed product statistics obtained annually by the Bureau of Mines. The extent of comparability of product statistics of the two agencies is indicated in a table shown at the end of the specialized text for each industry report.

The list of products for which separate information was collected was prepared after extensive consultation with industry members and representatives of the Bureau of Mines and other government agencies.

In general, figures were collected on both quantity and value of shipments. The shipments include commercial shipments and transfers of products to other operations of the same company. For products which are used to a significant extent within the same establishment for power or heat and for minerals mined and prepared in the same establishment, total production or separate data on production for such uses was collected. Typically, production was also collected for products for which there usually are significant differences between total production and total shipments as a result of stock changes.

For contract service industries, the amount received or due for services performed during 1967 was collected as a measure of output. For mine operators who also perform contract services, the amount received for such services was added to the total value of products shipped to determine total "value of shipments and receipts" for each establishment.

Table 6 of each report for individual industries provides the national and regional total shipments from all industries for each of the products primary to the industries covered in the report. In some cases, it provides separate totals for the amount of each product made by the primary industry and the amount made by other industries. Where available, production statistics are included in this table.

Value Added in Mining—Since the 1954 census, this measure has been computed by subtracting the cost of supplies, etc., and purchased machinery from the value of shipments and receipts plus capital expenditures.

Value added avoids the duplication in the value of shipments figure which results from the use of products of some establishments as supplies, energy sources, or materials by others. Moreover, it provides a measure, not only of value added in mineral production, but also in the development of mineral properties. For these reasons, it is considered to be the best value measure available for comparing the relative economic importance of mining among industries and geographic areas.

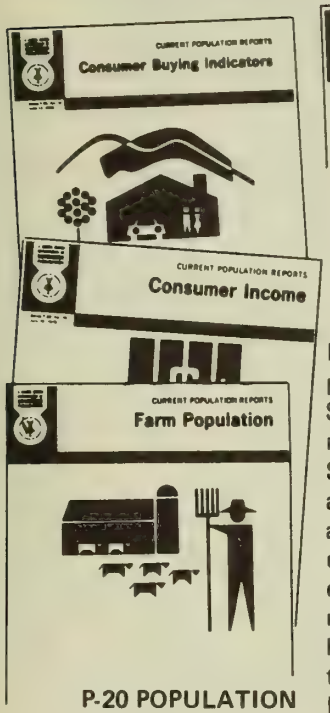
"Value of shipments" used in this calculation includes the shipments of all products of the mining establishment, together with receipts for contract work done for others.

"Capital expenditures" used includes expenditures for development of mineral properties as well as for new construction and major alterations of preparation plants and other structures and expenditures for new and used machinery and equipment. The

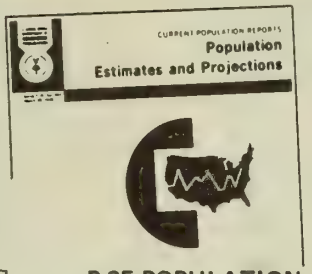
"costs" used in this calculation include costs charged to both the current and capital accounts. Both the shipments and costs figures include products bought and resold in the same condition.

For 1939 and earlier years, comparable data are not available for capital expenditures or for costs of capitalized supplies and equipment. However, a rough measure of value added in mining is computed for these years by subtracting from the value of net production and receipts, the cost of supplies, purchased fuels and electric energy, and contract work.

Value added in mining should not be confused with "national income originating in mining," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), U.S. Department of Commerce. The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of mineral industries. "Income originating" excludes, in addition to cost of materials, such other costs as depreciation charges; State and local taxes (other than corporate income taxes); allowance for bad debts; and purchases of services from other industries not included in the census contract costs, such as services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.



In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by manufacturing establishments of companies classified as being primarily mining; and conversely, in the exclusion of some part of the net value added in mining establishments of companies classified as primarily manufacturing. For mining as a whole, the net effect decreases income originating.



Fuels and Electric Energy—In table 7, information on the use of fuels and electric energy is provided for the year 1967.

Separate figures are shown for coal, fuel oil, gas, gasoline, and other fuels used for power and heat; purchased electric energy generated by mining establishments; and energy generated less sold. Figures are also shown for the quantity of coal, crude petroleum, and gas produced and used at the same establishment for power and heat.

CURRENT POPULATION REPORTS

In addition to the findings of the Census of Population, conducted every ten years, the Bureau of the Census publishes continuing and up-to-date statistics on population counts, characteristics, and other special studies on the American people. Data are issued in the eight separate series of reports described herein and released under the general title, Current Population Reports.

P-20 POPULATION CHARACTERISTICS.

Current national and, in some cases, regional data on geographic residence and mobility, fertility, education, school enrollment, marital status, numbers and characteristics of household and families, etc. Approximately ten reports each year.

P-23 SPECIAL STUDIES.

Infrequent reports on methods, concepts, or specialized data.

P-25 POPULATION ESTIMATES AND PROJECTIONS.

Monthly estimates of the total population of the United States; annual mid-year estimates of the population of States, by broad age groups, and of the United States by age, color, and sex; annual estimates of the components of population change. Estimates of the population selected metropolitan areas and their component counties. Projections of the future population of the United States and individual States. Approximately 20 reports each year.

P-26 FEDERAL-STATE COOPERATIVE PROGRAM FOR POPULATION ESTIMATES.

Population estimates for counties for selected States in which the figures are prepared by a State agency as part of the Federal-State Cooperative Program for Local Population Estimates.

P-27 FARM POPULATION.

(Census-ERS). Data on the size and selected characteristics of the farm population of the United States. Issued jointly with the Economic Research Service, U.S. Department of Agriculture. One or two reports each year.

P-28 SPECIAL CENSUSES.

Results of population censuses taken at the request and expense of city or other local governments. Subscription includes only the quarterly and annual summaries showing the total population figures for all the censuses conducted during the particular period. Individual reports issued for areas of 50,000 or more, showing the population by age, sex, and color are available separately. See "How to Order Reports." Five reports each year.

P-60 CONSUMER INCOME.

Information on the proportions of families and persons at various income levels. Also data on the relationship of income to age, sex, color, family size, education, occupation, work experience, and other characteristics. Two reports each year.

P-65 CONSUMER BUYING INDICATORS.

Information on the proportion of households reporting intentions to purchase automobiles, houses, and household equipment within a particular period of time. Also data on recent purchases. Quarterly.

HOW TO ORDER REPORTS

All Current Population Reports are sold as a single subscription for $14.00 a year. This price includes Series P-20, P-23, P-25, P-26, P-27, P-28 (quarterly and annual summaries only), P-60, and P-65.

Subscriptions to individual series are not sold separately but single copies of reports issued in all series except P-28 may be obtained from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Individual city or area reports in the P-28 series may be ordered from the Bureau of the Census. Prices for these reports vary. For information on titles and prices of individual reports issued in all CPR series, write to Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.

C3.186: (Nos.)

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS

From the Bureau of the Census

CURRENT INDUSTRIAL REPORTS

Keep up-to-date with Bureau of the Census data covering over **5,000 products** *representing 40% of all manufacturing in the United States!*

The Bureau of the Census issues a continuing series of more than 100 monthly, quarterly, and annual reports on industrial production...inventories... and orders. Broad categories included in the Current Industrial Series include:

All Manufacturing Industries
- Manufacturers' Shipments, Inventories, and Orders
- Manufacturers' Export Sales and Orders
- Shipments of Defense-Oriented Industries

Processed Foods
Textile Mill Products
Apparel and Leather
Lumber, Furniture, and Paper Products
Chemicals, Rubber, and Plastics
Stone, Clay, and Glass Products
Primary Metals
Intermediate Metal Products
Machinery and Equipment

For further information on all reports included in these categories, frequency of reports, subscription prices, and a publications order form, free of charge, write to the Publications Distribution Section, Bureau of the Census, Washington, D.C. 20233.
